UMM SAID

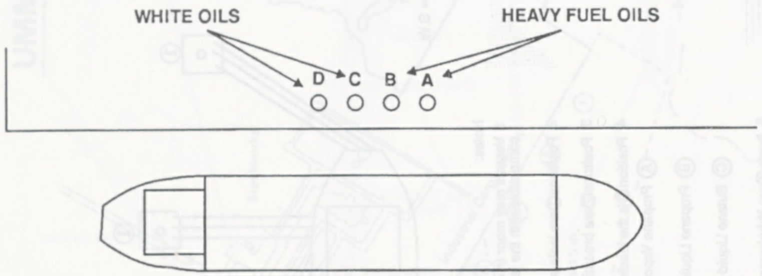
NODCO No. 6

"Plan Supplied By Ships Master"

UMM SAID

NODCO NO. 6



The Jetty has bollards spaced at 21.5 m. intervals. The jetty fendering consists of solid rubber, cylindrical fenders of 1.5 m. in length and 1.0 m. in diameter, spaced at 10.5 m. intervals.

Mooring Arrangements:

1. Vessels may moor in either direction at the Pilot's discretion.
2. The actual "tie-up" will be 3, 3 & 2 Fore and Aft. (3 Head/Stern Lines, 3 Breast Lines & 2 Springs)
3. Maximum permitted length overall 780 ft. (238 m.)
4. Maximum bow or stern distance to manifold 390 ft. (119 m.)
5. Maximum beam 45 m.
6. Maximum arrival displacement 60,000 tonnes.
7. Minimum depth of water at berth 13.00 m.
8. Extreme care should be taken to tend to moorings and gangway, especially in NW'ly winds.

Loading Arrangements:

1. A & B represent 8 in. loading arms for heavy fuel oil.
2. C & D represent 8 in. loading arms for other products (White Oil).
3. The pumping rates are as follows :-

   Heavy fuel oils 1,200 cu.m./hour with two loading arms and 500 cu.m./hour with one loading arm.

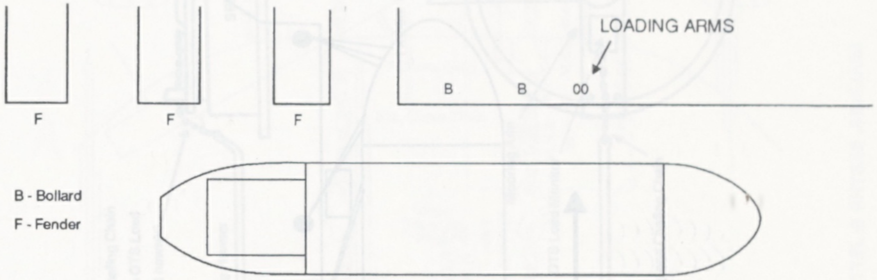
   White oils 1,000 cu.m./hour with two loading arms and 400 cu.m./hour with one loading arm

---

UMM SAID

ETHYLENE LOADING BERTH

QAPCO No. 19



The jetty has bollards spaced at 17 m. intervals apart from those which are depicted separately on the above diagram. The jetty fendering consists of solid rubber, cylindrical fenders of 1.5 m. length and 1.0 m. diameter spaced at approximately 10.0 m. intervals, apart from those depicted separately on the above diagram.

Mooring Arrangements:

1. Vessels moor in either direction at the Pilots discretion
2. The actual "Tie-up" is 3, 3 & 2 Fore & Aft. (3 Head/Stern Lines, 3 Breast Lines & 2 Springs)
3. There is no restriction on the L.O.A. because Ethylene tankers are all of a certain size, which can be accommodated quite safely at the present moment. As a general guide though any vessel having a stern to manifold distance in excess of 94.0 m. should ask the terminal for further details prior to arrival.
4. Minimum depth of water at berth is 42 ft. (12.80 m.)

Loading Arrangements:

1. Liquid Ethylene is loaded through one Chicksan type 12 in. loading arm. On the North side of the loading arm there is a similar 6 in. vapour return arm. Flanges are class 150 ASA
2. Total development height of arms is 46 ft.
3. Maximum loading rate available 600 tonnes/hr.

No repairs to main engines allowed while vessels are alongside the pier.

Mooring ropes shown above are the safe minimum number for average weather conditions.

If necessary, additional mooring ropes may be required by the Pilot of ASESA Harbour Master.

Nylon ropes may be supplied by ASESA if any vessel does not have a sufficient quantity of suitable ropes for safe mooring.

Mooring ropes must be carefully tended to hold the vessel close to the dolphins at all times.

Export Tanker
(120,000 tonne)

NOTES

1 Ropes number 1 & 4 forward and ropes number 1 & 2 aft are the main departure ropes. Ensure that these can be cast off last.

2 If ropes number 8 forward and number 7 aft cannot be used then rope number 4 forward and number 2 aft will have to be doubled up.

3 The mooring lay-out shown is the minimum requirement.

For vessels proceeding to Istanbul, or any other ports within the Sea of Marmara or Gulf of Izmit pilotage is compulsory from the southern entrance. The same applies for vessels proceeding outwards. Pilotage is not compulsory for vessels proceeding from Gelibolu to Darica, but is compulsory within the Gulf of Izmit. For through traffic pilotage is not compulsory for the Bosphorous and Dardanelles.

All pilot stations monitor V H F channel 16.

IMMINGHAM
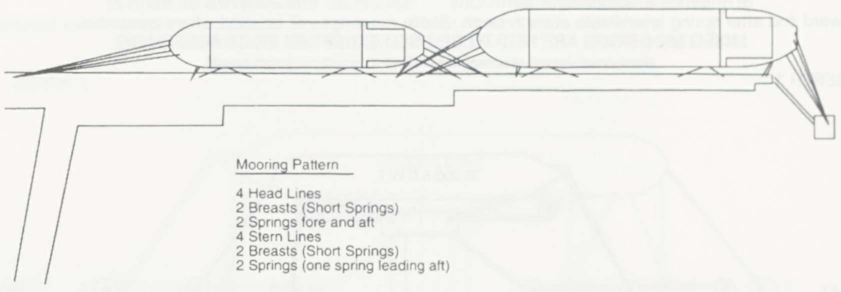
BULK TERMINAL
MOORING GUIDE

For Guidance Only :
Immingham Bulk Terminal cannot be held responsible for ineffectually moored vessels. This is the responsibility of the Master.

COAL VESSELS 30,000 DWT

ORE VESSELS 75,000 DWT

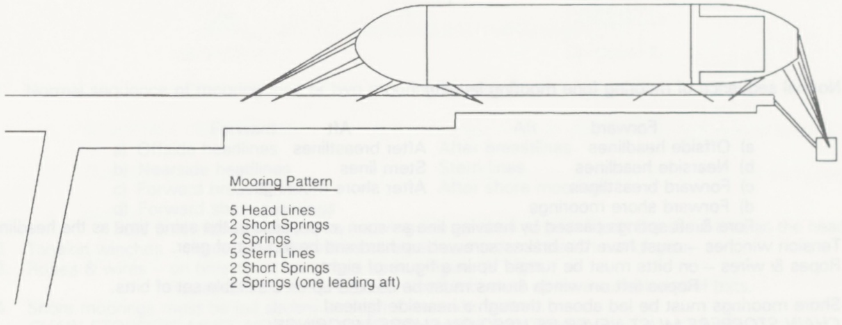


Mooring Pattern

- 4 Head Lines
- 2 Breasts (Short Springs)
- 2 Springs fore and aft
- 4 Stern Lines
- 2 Breasts (Short Springs)
- 2 Springs (one spring leading aft)

1. Tension winches should be checked at each turn of tide.
2. Ropes and wires should be kept tight, particularly at L.W. slack.
3. Advice on mooring, tugs, weather conditions etc, is available from the Jetty Control Office.
4. Ore vessels must at all times have an aft leading spring which must be kept tight so as to prevent any movement along berth.
5. Tugs are at the discretion of Master and Pilot(s).

ORE VESSELS 100,000 DWT



Mooring Pattern

- 5 Head Lines
- 2 Short Springs
- 2 Springs
- 5 Stern Lines
- 2 Short Springs
- 2 Springs (one leading aft)

IMMINGHAM

OIL TERMINAL INFORMATION SHEET 1

MOORING REQUIREMENTS – VESSELS 20,000-39,999 TONS SUMMER DEADWEIGHT

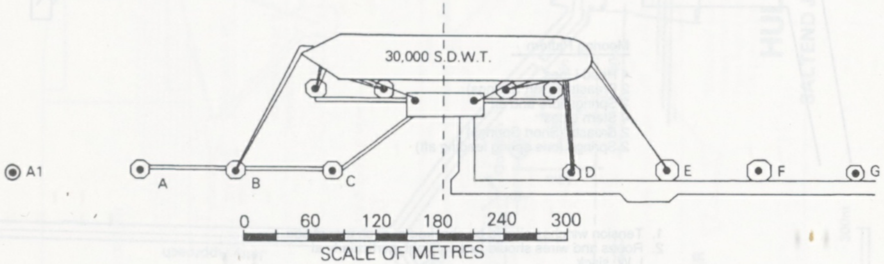
THERE MAY BE AN ALTERATION TO THE MOORING PATTERN DUE TO THE POSITION OF THE SHIPS EQUIPMENT

MOORING ARRANGEMENT

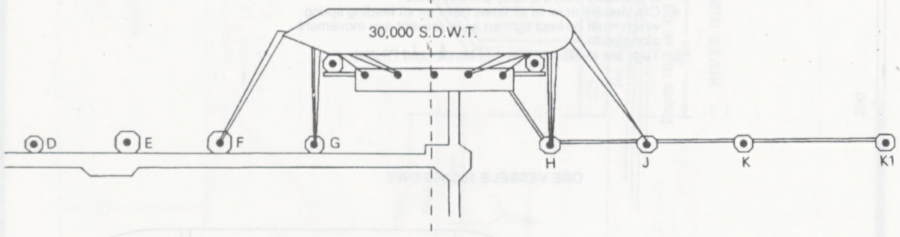
2 Headlines	2 Sternlines
3 Forward Breastlines	3 After Breastlines
3 Forward Springs	3 After Springs

2 shore breast moorings (80 mm. diameter nylon tail) are available from:-
B(1), C(1) & E dolphins for Berth One F & J dolphins for Berth 2.
A forward and after spring is available at each berth. Shore moorings will be used where practcable.
MIXED MOORINGS ARE NOT TO BE USED EXCEPT BY PRIOR AGREEMENT
(Position of vessel, assuming Bow/Manifold is half the length overall)

BERTH 1



BERTH 2



1. Normal sequence of mooring (one mooring launch)

Forward	Aft
a) Offside headlines	After breastlines
b) Nearside headlines	Stern lines
c) Forward breastlines	After shore moorings
d) Forward shore moorings	

Fore & aft springs passed by heaving line as soon as possible at the same time as the headlines

2. Tension winches – must have the brakes screwed up hard and be left out of gear.
3. Ropes & wires – on bitts must be turned up in a figure of eight.
   Ropes left on winch drums must be backed up on a suitable set of bitts.
4. Shore moorings must be led aboard through a nearside fairlead.
   CHAIN STOPPERS MUST NEVER BE USED ON SHORE MOORINGS
5. Under no circumstances are any moorings to be adjusted other than at the slack water period after consultation with the berthing master.
6. Communication alongside – A VHF radio is provided for a direct link to the control room and berth operator.

P

Berth No. 3

1. Normal sequence of mooring (one or two mooring launches)

FORWARD	AFT
(a) Offside Headlines	After Breastlines
(b) Nearside Headlines	Sternlines
(c) For'd Breastlines	

1. Fore & Aft springs passed by heaving line as soon as possible, at the same time as headlines.

2. Tension winches must have the brakes screwed up hard and left out of gear

3. Ropes and wires on bitts must be turned up in a figure of eight

Under no circumstances are any moorings to be adjusted other than at the slack water period after consultation with the Berthing Master

Communications alongside - A VHF Radio is provided for a direct link to the control room and Berth Operator

MOORING PLAN — QUEEN'S DOCK

For 12,000 tons (and upwards) deadweight tankers berthed at Jetties 2,3,4,5

These are the minimum requirements which may be varied at the discretion of the Docks Supervisor/Berthing Master to suit the size of ship and existing or impending bad weather conditions.

Rope messengers are attached to the shore wires and are passed on board from the Jetty or attendant mooring boat.

Shore stern wire must not be shipped through the centre fairlead

Mississippi River Crossing Channels

The project depth for crossing channels is 45 ft. for a width of 500 ft. to mile 150 AHP and 40 ft. above.

The controlling depths are published in Navigation Bulletins issued periodically by The New Orleans District Corps of Engineers, New Orleans, Louisiana.

Crossing channels may be marked by buoys during Low Water.

Pollution Reports

Report all spills of oil and hazardous substances to The National Response Center via 800-424-8802 (toll free), or to the nearest U.S. Coast Guard facility if telephone communication is impossible (33 cfr 153).

Warning

The Prudent Mariner will not rely solely on any single aid to navigation, particularly on floating aids. See U.S. Coast Guard Light List & U.S. Coast Pilot for details.

Caution

Mariners are warned that logs and other floating debris are constant dangers to navigations. Night travel by small craft is not recommended because of the hazard of floating obstructions.

MOORING ARRANGEMENTS FOR
50,000 DWT VESSELS & ABOVE

NOTE: Due to tidal currents, near proximity of passing vessels, and exposure of your vessel to Westerly winds, particularly in light condition, the following mooring arrangement is required.
Double spring lines to be used both forward and aft. Both forward and aft springs may lead through the same chocks at their respective locations, however, each spring line should be secured to a separate bollard on the dock.
The bow breast line deadman is approximately 137 m. from the vessel. A manila or synthetic line must be used as it is impossible to pull a wire to the shoreline here.
A shore messenger will be used to pull this line to the deadman.

Legend:
The Port of Palm Beach is located on a saltwater sound known as Lake Worth and lies 1⅓ miles from the 37-foot contour of the Atlantic Ocean, to which it is connected by an artificial cut at the North end of Lake Worth known as Lake Worth Inlet.
(1) Entrance to the harbour is by a dog-leg channel running due West through the jetties and then turning Southwesterly to the terminals, 400 ft. wide, narrowing to 300 ft. in width as it continues across the lake another 3,000 ft., leading into a trapezoidal turning basin. (2) 1,400 ft. by 1,310 ft., adjacent to the port terminals on the West shore. Depth of the channel and turning basin is 35 ft. (3) Slip No. 1 is 690 ft. in length with water depth of 27 ft. (4) Slip No. 2 is 650 ft. in length with water depth of 35 ft. (5) Extension of turning basin with water depth of 25 ft. (6) Three Ro/Ro ramps and the New North Wharf, which together comprise 1,054 ft. in length.

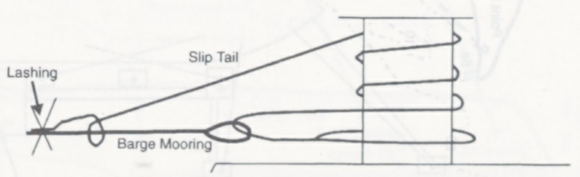
SELF UNLOADING BARGE "NOATAK"



Lashing
Slip Tail
Barge Mooring

A Nylon slip tail with one eye splice only will be passed from the barge (or tug) to the ship and made fast in the manner illustrated here.
The system is devised to minimize the rope work on the ships side and permit quick release in case of emergency.

RIVERHEAD

SUGGESTED MOORING PLAN — NORTH BERTH

The diagram above represents a suggested mooring arrangement for the North berth of the Northville Industries Corporation tanker platform at Riverhead, New York.

The ship plan represents a 30,000 to 40,000 d.w.t. handy size tanker with bridge amidship.

Mooring operations at Tosco are conducted as Follows:

1. With the vessel alongside the breasting dolphins, run spring lines fore and aft to maintain desired position. Spring line leads must provide adequate scope.
2. The launch will carry a messenger from the mooring dolphins to the bow or stern to run head, stern, and breast lines. The line crew will work one end of the ship at a time, as requested by the Master.
3. Each mooring line should be secured to an individual set of bitts. Placing two lines on one set of bitts by taking round turns should be avoided.
4. All lines must be tight, and the mooring plan adequate for all anticipated weather conditions before the transfer arms will be connected.
5. The ship's gangway is not used at this terminal.

RIVERHEAD

SUGGESTED MOORING PLAN — SOUTH BERTH

The diagram below represents a suggested mooring arrangement for the South Berth of the Tosco Industries Corporation tanker platform at Riverhead, New York.
The ship plan represents a 30,000 to 40,000 DWT handy size tanker with bridge amidship.

Mooring operations at Northville are conducted as follows:

1. With the vessel alongside the breasting dolphins, run spring lines fore and aft to maintain desired position.
2. The launch will carry a messenger from the mooring dolphins to the bow or stern to run head, stern, and breast lines. The line crew will work one end of the ship at a time, as requested by the Master.
3. Each mooring line should be secured to an individual set of bitts. Placing two lines on one set of bitts by taking round turns should be avoided.
4. All lines must be tight, and the mooring plan adequate for all anticipated weather conditions before the transfer arms will be connected.
5. The ship's gangway is not used at this terminal.

The dock is constructed of steel piles with a concrete floor and consists of a central platform and two breasting dolphins. Both the platform and the breasting dolphins have a wood faced steel pile fender system with moulded rubber impact energy absorber installed between the outer fender and the main dock structures.

BEJAIA: (Also see Page 5)

SHIPMASTER'S REPORT: March 1994.
Note: The report was received in November 1994.
Vessel: 96,000 d.w.t. combination carrier operating in tanker mode.

Tugs available are of very low power and there is a very small Turning Basin inside the breakwater and close to the berth (S.W. of Berth No. 3 and S.E. of Berth No. 2). Due to above reasons, berthing in adverse conditions of wind and swell is very difficult and risky (All vessels have to be swung 180° in the Basin as, on Berth No. 3 always port side alongside and on Berth No. 2 always starboard side alongside).

Large ships always berth on Berth No. 3.

Cargo operations can be suspended and vessel can be shifted to roads with wind force going up to Force 4 or 5.

Any stores, charts, etc., sent to Bejaia can take as long as 7 days to clear Customs.

Shore leave not advisable at time of our visit.

Angola

KIABO MARINE TERMINAL: 07.20 S. 12.35 E.
(See Late Plans)

LOCATION: *Terminal Description:* The FPSO "Ocean Producer" is a Floating Production, Storage and Offloading vessel, located in territorial waters off the Coast of Angola, West Africa. The FPSO is a converted 78,061 d.w.t. export tanker, registered under the Liberian flag and has an overall length of 789 ft. The loaded draft is 44 ft. The total crude oil storage capacity is 514,000 barrels. The water depth at the location is 250 ft. with no significant change in depth within the operating area.

With a bow heading of 022.5° from true North, the FPSO has permanent moorings port and starboard to buoys off the bow and stern quarters (See "Plans" – Figures 1 and 2).

Two sub-sea production wellheads are 552 ft. astern of the FPSO (See "Plans" – Figures 1 and 2).

There is a laboratory onboard, capable of carrying out a limited number of tests on the crude oil stock.

There are no facilities to receive dirty ballast.

FPSO "Ocean Producer" Radio Call Sign: "5 LBJ".
Inmarsat "A" I.D. No. (871) 124-1412.

Operating Location:
FPSO Stern Co-ordinates: Lat. 07° 20′ 30″ S., Long. 12° 35′ 24″ E.
Angolan Shoreline: 17 nautical miles.
Water Depth: 250 ft.

Note: A maritime Exclusion Zone has been established around the Terminal. Vessels are not permitted to enter this area without authorisation from the Company.

The Exclusion Zone is bounded by the following co-ordinates:
Lat. 07° 19′ 30″ S., Long. 12° 35′ 00″ E.
Lat. 07° 19′ 30″ S., Long. 12° 38′ 00″ E.
Lat. 07° 21′ 30″ S., Long. 12° 35′ 00″ E.
Lat. 07° 21′ 30″ S., Long. 12° 38′ 00″ E.

PILOTAGE: Pilotage is compulsory within a 1.5 miles radius of the Marine Terminal.

Use of Mooring Master by Export Tanker: Mooring Master will meet the vessel before it proceeds to the Kiabo Field Marine Terminal. Mooring Master will advise the Export Tanker's Master on approaches to the FPSO, mooring and unmooring, connecting and disconnecting hoses, and in all other operations within the Marine Terminal area. All manoeuvring of ships within the Terminal area shall be done with the advice of Mooring Master, subject to the understanding that in all cases and circumstances the Master of the vessel being manoeuvred shall remain solely responsible, on behalf of this vessel's Owner for the safety and proper manoeuvring of the vessel. The Export Tanker's Master or qualified Deck Officer must be on the bridge at all times while the ship is manoeuvring.

Visiting Export Tankers may not commence final approach to the Marine Terminal until the Mooring Master from the FPSO is aboard, has completed all required safety checks and has authorised the Export Tanker's Master to proceed with final approach to the mooring.

Boarding Procedure: From FPSO to Export Tanker:

Prior to commencing final approach and after completion of all preparatory radio signals with the FPSO, the Export Tanker shall advise the FPSO of its speed and heading, as well as the location and status of the gangway for boarding by the Mooring Master. The Export Tanker's Master shall ensure Export Tanker's crew availability and readiness to facilitate safe alongside boarding by the Mooring Master. Export tankers are requested to have a pilot ladder safely and securely rigged, ready for immediate use, and long enough to reach the Mooring Master's boat. A life-ring with a heaving line should be provided near the pilot ladder for immediate use. If at night, adequate lighting must be rigged overside for the Mooring Master's ladder. Vessels will provide a lee for Mooring Master, both when boarding and leaving. If a pilot ladder is not suitable for use, then it is the responsibility of the Export Tankers' Master to change it. Vessels with a freeboard greater than 30 ft. are requested to provide a combination pilot and accommodation ladder.

Exchange of Arrival Documentation:

When the Mooring Master is safely aboard the Export Tanker, all required and designated documentation shall be exchanged between the Export Tanker's Master and the Mooring Master. When the exchange is completed, the Mooring Master shall so notify the FPSO Master.

Validation of Safety Condition/Measures:

Prior to authorising final approach to mooring, the Mooring Master shall satisfy himself that all requirements relative to safety conditions and measures aboard the visiting Export Tanker are in place and/or in a state of readiness according to the parameters of the OCIMF/ICS "Ship to Ship Transfer Guide".

Concurrence of Emergency Procedure: (ESD/Fire/others):

Prior to authorising loading and connection of transfer hose to the Export Tanker, the Mooring Master shall determine from the Export Tanker's Master that the Export Tanker's crew is in a state of readiness and is proficient in emergency safety, fire and other related procedures to ensure maximum safety during ship-to-ship cargo transfer operations.

APPROACHES: *Approach to Marine Terminal:*

1. Anchorage Area:
   The anchorage area for vessels awaiting the loading berth at the Kiabo Field Marine Terminal is at the Master's discretion, but in any event shall not be within the Exclusion Zone.
2. Mooring Master Pick-Up Zone:
   The Mooring Master Pick-Up Zone is an area between 2.5 – 3.0 miles N.W. of the FPSO location. Vessels should take a suitable heading to allow safe access for the Mooring Master. Following receipt of instructions from the Company or the Mooring Master, an Export Tanker should proceed from the anchorage area to the Mooring Master pick-up zone, where the vessel will be boarded by the Mooring Master.
3. Marine Terminal Safety Zone:
   Export tankers are prohibited from navigating within the safety zone at Kiabo Field Marine Terminal at any time unless the Mooring Master is on board. The safety zone is within 1.5 miles radius of the FPSO.

ANCHORAGE: No vessel may anchor within the Exclusion Zone. For Export Tankers requested to anchor, the recommended anchorage area is located East of location in 165 ft. of water. Anchoring within the FPSO's mooring legs is strictly prohibited. Prior to arrival, the Master of Export Tanker should contact the FPSO for information concerning anchorage positions. B.A. Chart No. 604 describes the area.

If an Export Tanker is not scheduled to moor on arrival, or the Terminal is closed due to adverse weather conditions, etc., the Export Tanker's Master will be advised by VHF radio and requested to anchor.

FPSO ACCEPTANCE CRITERIA FOR EXPORT TANKER:
Displacement/Cargo Capacity: FPSO capacity is 514,000 bbls. Export tankers should have a minimum arrival displacement not less than 25% Summer deadweight. Prior notice must be given of any Export Tanker not able to comply, and an agreement must be reached with the Master of the FPSO.

RESTRICTIONS: Mean sea water depth at the FPSO is 250 ft., no draft restriction. Mooring and unmooring during daylight hours only (See "Berthing").

MAX. SIZE: 150,000 d.w.t. Also see "Berthing".

RADIO: *Arrival Time:* The Export Tanker shall send an initial estimated time of arrival (ETA) message to Sonangol P&P upon departure from the previous port. The message should be updated 72 hours, 48 hours and 24 hours before arrival at the FPSO location.

Initial ETA: It is important that all in-coming Export Tankers advise Sonangol P&P at least 72 hours before the estimated time of arrival, giving best estimate of the ship's arrival time at the Marine Terminal via the operator.

Time to be used for ETA is the local time zone of GMT +1 hour throughout the year.

The first message should include the following information:

(a) Name of Export Tanker and radio call sign.
(b) Inmarsat "A" I.D. number for voice, fax and telex, if so fitted.
(c) Cargo requirements.
(d) Maximum loading rate.
(e) Arrival draft, fore and aft.
(f) Last port of call.
(g) Confirm that vessel has clean Bill of Health.
(h) If there is any sickness onboard, give all available information as to the possible type of sickness.
(i) Distance in feet from the bow to the loading manifold on the Export Tanker.
(j) Total length overall (LOA).
(k) If the ship's hose connections are different from a 16 in. flange.
(l) Name and full style of local Agent.

Subsequent ETA's: Further ETA messages should be sent to Sonangol P&P when the Export Tanker is 48 hours and 24 hours from the Terminal, and additional notification shall be given if the vessel's ETA will vary from the original notification by 6 hours or more. Notwithstanding the foregoing, in case the sea passage from the vessel's last port is less than 72 hours from the Kiabo Field Marine Terminal, the first notice shall be given immediately after leaving such port of call, and subsequent notices shall be given at regular time intervals.

Should the ETA change by one hour or more following the 24 hours notice, the vessel shall promptly notify Sonangol P&P of the new ETA.

Export Tanker Pre-Arrival Questionnaire: All Export Tankers will be required to complete the Export Tanker Pre-Arrival Questionnaire prior to arrival at the Terminal.

1. Vessel's name and call sign:
   Previous name(s):
2. Flag:
3. Year built and class:
4. Owners/Managers (including address and telex number):
5. Nationality of Master: Officers: Crew:
6. Last port of call / date:
7. Date of last dry dock / special survey:
8. Summer deadweight and draft:
9. Arrival draft and displacement:
10. Vessel dimensions (metres): LOA: Beam:
    Moulded depth:
11. Terminal factor (LOA × Beam × M.Depth):
12. Distance between bow and manifold:

13. Manifold size/crossovers onboard (the Export Tanker will be expected to provide all crossovers, etc., for connection to the FPSO 16 in. floating hose assembly):
14. Hose boom S.W.L.:
15. Length of anchor chains: Port: Starboard:
    Are there cleats and/or bits in manifold area for securing overside hose?
17. Quantity and quality of slops onboard / L.O.T. intended?
18. Quantity of ballast onboard / are tanks segregated:
19. Vessel should not be less than 25% d.w.t. on arrival. Can vessel load and deballast simultaneously with 2 valve segregation to maintain 25% d.w.t. minimum?
20. If answer to (19) is NO, state deballast time required before loading:
21. State maximum loading rate (single 16 in. hose):
22. Is an Inert Gas System fitted? Are tanks under Inert Gas?
23. Is a crude oil washing system fitted?
24. Advise the number, size and locations of bow Panama leads (or equivalent):
    Note: Bow fairlead should be at least 23.6 in. × 17.7 in.
25. Is vessel fitted with Smit Brackets or patent chain stoppers in bow area? If so, state number, type and S.W.L.:
26. How many sets of bitts are located in the bow area:
27. What are the distances of these bitts from the bow fairleads:

Owner warrants vessel able to discharge ballast and load back cargo simultaneously (with two valve segregation) whilst maintaining a minimum 25% d.w.t. Any relaxation due to non-compliance with this clause is for Owner's account.

In any case of the vessel's deficiency in mooring design or hose handling capability, the Terminal will reserve the right to accept the vessel and will not, in any case, be responsible for any delay or costs arising from such deficiency.

VHF: *Radio Communication:* VHF/FM Channel 16 (156.8 MHz).

The FPSO maintains a continuous watch on VHF/FM Channel 16 and Export Tankers' Masters are recommended to use this channel when they are within range of the Kiabo Field Marine Terminal. Particularly when approaching the Marine Terminal, attention to VHF/FM communications will minimise the risk of delays in mooring.

During mooring operations, the Export Tanker's radio will be under sole control of the Master. Masters are reminded that if their vessel is requested to anchor to await mooring, it is their responsibility to maintain a constant listening watch on VHF Channel 16 to receive Marine Terminal instructions. Any delay due to failure to maintain a constant listening watch on Channel 16 will be for the Export Tanker's account and will not be included in a subsequent laytime calculation.

The communication equipment onboard the FPSO is capable of switching to all VHF marine frequencies.

Communications After Mooring Master has Boarded: For subsequent intership communications between the Export Tanker and the FPSO, portable VHF/UHF radio-telephone units will be utilised by the Mooring Master. These sets will be intrinsically safe.

General:

(1) Any telephone, portable VHF/UHF and radio-telephone systems utilised shall comply with applicable safety requirements.

(2) At a minimum, continual voice communication shall be maintained between the FPSO and the Export Tanker, Mooring Master and the Export Tanker's Chief Officer.

(3) The selected communication channels to be used shall be assigned prior to the final approach of the Export Tanker and shall be recorded on the appropriate forms, as per applicable regulations.

(4) All communications shall be in the English language.

Pre-Arrival/Arrival Exchanges:

(1) Prior to initiating final approach to mooring, the Export Tanker shall notify the FPSO of:
  (a) Course (heading).
  (b) Speed.
  (c) Location.

(2) The FPSO shall then advise the Export Tanker of the ETA of Mooring Master and his transportation type (utility boat, etc.).

(3) The Export Tanker shall advise the FPSO of the following:
  (a) Tanker draft and trim.
  (b) Available tank capacity for loading.
  (c) Disposition, composition and quantities of ballast plus time required for discharge and maximum light freeboard.
  (d) Quality of Inert Gas.
  (e) Any other information that may be deemed relevant.

Emergency Procedure:

(1) Prior to the commencement of any operational phase, a secondary, stand-by procedure for the communication of emergency signals shall be established, agreed upon and understood.
  Signals should include, as a minimum:
  (a) Radio Communication Inoperative.
  (b) Stand-by.
  (c) Start Loading or Start Discharging.
  (d) Slow Down.
  (e) Stop Loading or Stop Discharging.
  (f) Emergency Stop.
  (g) Emergency Disconnect.

(2) When primary radio communication fails, all mooring and/or cargo transfer operations should be suspended pending restoration of the service.

(3) Immediately when the need for emergency signalling procedure becomes evident, action should be taken to determine and correct the problem.

TUGS: *Use of Boat Services by Export Tanker:* Export tankers shall not undertake final approach to the designated mooring without the assistance of a tug.

On Arrival – Lines and Hoses: Preparation for mooring will be advised by the Marine Terminal through VHF radio communication prior to the Export Eanker's arrival or by the Mooring Master before the mooring operation commences. The Export Tanker will moor with her bow to the Marine Terminal FPSO. Prior to mooring, Export Tankers are required to have ready on the starboard side, a derrick at least 10 tons SWL, rigged and ready for connecting and disconnecting the cargo transfer hose.

Similarly, the Export Tanker shall be rigged and ready to heave up the mooring hawser from the FPSO as well as the towing wire from the hold back tug.

(1) While the tug is assisting the Export Tanker to the designated mooring location, a workboat shall deliver the FPSO bow hawser pick-up line to the Export Tanker.

(2) When the Export Tanker is secured, a workboat shall deliver the cargo transfer hose to the Export Tanker.

(3) After all mooring services are completed, the tug shall maintain sufficient thrust astern, so as to keep the bow hawser between the Export Tanker and the FPSO in constant tension. The workboat shall stand-by and be prepared to render any assistance required during cargo transfer operations.

On Departure:

(1) When summoned, the workboat shall approach the Export Tanker to assist in disconnection and retrieval of the cargo transfer hose.

(2) The workboat shall then assist in retrieval of the bow hawser.

(3) The tug shall then assist the Export Tanker in preliminary manoeuvring in preparation for departure.

Safety Precautions Aboard Export Tanker:

(1) All cargo tanks on the Export Tanker are to be gas free, all cargo tank lids, ballast tank lids and ullage ports shall be closed before the tug(s) comes alongside the Export Tanker.

(2) No tugs or any other vessels shall be permitted alongside until the Master of the Export Tanker has determined that it is safe.

BERTHING:

Operating Layout:

(a) FPSO Length: 789 ft.
(b) FPSO Bow Heading: 022.5°
(c) Permanent Moorings and Marker Buoys: 6
(d) Mooring Tie-In Locations, Quantities and Headings: (See "Plan")

Port Bow (1) 322.5°	Starboard bow (2) 080° and 085°
Port Stern (1) 262.5°	Starboard stern (2) 140° and 145°

(e) Wellheads: 495 ft. from FPSO, due astern on bearing 202.5°
(f) Export Tanker Berthed Heading: 172°
(g) Export Tanker Minimum Berthed Distance: 250 ft.
(h) Export Tanker Stern Mooring: Tug (Company supplied).
Export Tanker Bow Mooring: Bow Hawser (FPSO supplied).
(i) Offloading Hose: 970 ft. (BCM – 130 ft.)

Hours of Operation: The Kiabo Field Marine Terminal will generally operate 24 hours a day, 7 days a week. Ships are loaded at any hour, weather and other circumstances permitting, and at the full discretion of the Company. Vessels are moored and unmoored during daylight hours only. In order to assure all mooring activities occur during daylight hours, an arrival time of 1200 hrs. local time is recommended.

Notices of Readiness: Mooring Master will act on behalf of the Company to acknowledge receipt of the vessel's "Notice of Readiness", which should be tendered at time of arrival. Arrival time will be considered as the time the anchor is dropped at the anchorage area. "Notice of Readiness" will be accepted as the time that the Mooring Master boards the vessel, or the Export Tanker shall have dropped anchor within the recommended anchorage area and has advised the Marine Terminal of the time of anchoring. Exception to the above will be if the Export Tanker is in the anchorage area awaiting arrival of the Mooring Master and has been requested by the Marine Terminal not to anchor. In this case, "Notice of Readiness" will be accepted from the time the Marine Terminal requested the ship not to anchor.

Marine Terminal Closure: "Notice of Readiness" will not be accepted during periods when the Marine Terminal is closed. The Marine Terminal is closed when the weather is such that it is too rough for Export Tankers to moor or remain safely moored to the FPSO. Any decision regarding the opening and closing of the Marine Terminal will be made solely at the discretion of the Company. In such case, the Marine Terminal will provide the Export Tanker's Master with a written notice of the time during which the port was closed due to adverse weather. Vessels required to leave the Marine Terminal area on account of weather should keep in contact with the Marine Terminal via VHF radio, in order that they will be readily available when weather moderates. The Company reserves the right to decline to moor a specific Export Tanker, if in the Company's opinion existing conditions or facilities are considered unsafe for mooring or loading, even though the mooring may be open to other Export Tankers. Various combinations of wind, sea and tidal conditions, as well as the size, length, ballasted trim, and handling qualities of a vessel can affect the decision to berth a vessel at the Marine Terminal. All of these factors have to be evaluated before a final mooring decision is made. Should an Export Tanker be rejected for any of the aforesaid reasons, the Marine Terminal will supply the Export Tanker and the Owners/Charterers with written reasons for non-acceptance.

Departure Procedure for Export Tanker:

(1) Documentation:
  After the disconnection of the cargo transfer hose and prior to preparing for departure of the Export Tanker, all necessary pre-departure documentation shall be completed.

(2) Export Tanker Departure:
  (i) Mooring Master shall witness the Export Tanker's closure of the cargo transfer hose end butterfly valve, disconnection of the cargo transfer hose from the manifold, and fitting of the blind flange on the end of the cargo transfer hose.

(ii) Workboat shall approach Export Tanker to accept free end of hose when lowered by Export Tanker.
(iii) Workboat shall tow hose away from Export Tanker to the pre-assigned storage area.
(iv) Export tanker shall check and confirm that all manifolds are securely blanked, that ship is clear of obstructions, that winches and windlass are powered and operational, that crew are standing-by and ready to cast-off.
(v) Area shipping traffic to be checked and confirmed to be clear.
(vi) "Check List 4 – Before Unmooring" to be completed.

MOORING: A bow mooring hawser and hold back tug is provided for visiting Export Tankers up to 150,000 d.w.t., partially loaded or in ballast to a maximum displacement of 80,000 tonnes.

Forecastle: The Export Tanker bow mooring comprises an 18 in. circumference mooring hawser, 250 ft. long with 30 ft. of 3 in. diameter chafing chain attached to both ends. The hawser is equipped with 1,448 ft. of pick-up line and pick-up hardware.

Stern: An Anchor Handling Tug Supply (AHTS) vessel is provided to assist the Export Tanker in mooring to the FPSO, and will attach its towing wire to the stern of the Export tanker to hold it off the FPSO during cargo transfer operations.

Weather Conditions:

(1) Prior to commencing mooring and/or cargo transfer operations, all available weather forecasts for the FPSO location should be obtained.
(2) The operation should proceed and/or continue only if both Master and the Mooring Master are satisfied that the prevailing and anticipated conditions are within the limits considered safe for such an operation.
(3) The Master of either vessel and/or Mooring Master may, at his sole discretion, order cessation of mooring or transfer operations. In such event, the Master of the other vessel shall immediately enact required procedures to cease such operations.

Mooring Criteria: Figure 7 (See "Plan") estimates the allowable wind speed along with the allowable significant wave height for a range of Export Tanker sizes that may be connected at the Kiabo Field Marine Terminal.

HOSES: Sufficient crew must be available at all times to carry out, under the supevision of a responsible licensed officer, the instructions given by the Mooring Master. Raising, lowering, connecting and disconnecting of the cargo transfer hose, as well as other labours and duties on the Export Tanker connected with the loading of cargo or maintaining mooring lines in a correct manner, will be performed by the Export Tanker's crew directed by a responsible officer as required by the Mooring Master. Export tankers must also have an adequate supply of reducers, gaskets and wrenches to connect the cargo transfer hose.

Cargo Transfer Hose Connection Aboard Export Tanker: The cargo transfer hose is a 970 ft. long assembly of 16 in. hose terminating at the Export Tanker end with a 25 ft. long barbell type hose. The final termination components comprise a butterfly valve, a short spool Camlock, and a blind flange. When the hose is not in use, the butterfly valve shall be kept closed. At all times, when the hose is not connected, the blind flange shall be securely fastened in place.

Procedure:

(1) The barbell end of the cargo transfer hose will be delivered to the Export Tanker which shall hoist and correctly locate the hose ready for connection to the Export Tanker manifold.
(2) Ensure that the butterfly valve is closed.
(3) Remove blind flange and store in a safe place.
(4) Mooring Master will witness the connection of the cargo transfer hose to the Export Tanker manifold and shall inspect the hose for kinks or damage.
(5) Before transfer commences, all required pre-transfer checks shall be performed and completed.
(6) Prior to cargo transfer commencing, open the cargo transfer hose end butterfly valve.
(7) The FPSO shall inform the Export Tanker of the rate capable of being supplied, and shall provide such rate as mutually agreed between the Export Tanker's Chief Officer and the FPSO Master. The receiving Export Tanker shall set the maximum rate, regardless of the pumping capacity of the FPSO.
(8) When satisfied that the cargo transfer hose is correctly attached and the Export Tanker systems are ready for full rate transfer operations, the Export Tanker's Chief Officer shall indicate readiness to proceed with cargo transfer.
(9) Transfer shall commence at an agreed low rate, in order to check that the loading system is correctly aligned, that no leakage occurs, and that all valves, venting system, and other apparatus are correctly arranged to facilitate cargo transfer according to the applicable regulations.

FPSO Supplied Components and Spares:

(a) Butterfly valve handle for cargo transfer hose (Mooring Master).
(b) VHF/UHF portable radio (Mooring Master).
(c) Paperwork (Mooring Master).
(d) Spare O-ring seal for Camlock blind flange (Mooring Master).
(e) Handle for Camlock flange (Mooring Master).
(f) Spare export hose sections (FPSO).
(g) Spare bow line hawser and associated parts (FPSO).

LOADING: *Cargo Transfer Hose Handling Provisions:* Cargo transfer from the FPSO is through a 16 in. diameter hose. This hose is 970 ft. long and is terminated at the Export Tanker end by a barbell type hose with a butterfly valve and shaft spool Camlock. When not connected to the Export Tanker, a blind flange is fitted to the open end of the Camlock (See "Plans").

(1) (a) When not connected to an Export Tanker, the cargo transfer hose shall remain in the sea.
  (b) A marker buoy (unlit) shall be permanently attached to the pick-up chain at the Export Tanker end of the transfer hose by a synthetic rope.
  (c) When not connected to an Export Tanker, the transfer hose shall be stored near the FPSO's No. 6 mooring leg with the hose marker buoy attached to a mooring buoy anchored near the No. 6 leg marker buoy.
(2) During handling operations prior to and following attachment to Export Tanker, care must be exercised to prevent kinking or other damage to the transfer hose. A minimum radius of 10 ft. for any bend in the hose is recommended.
(3) The Terminal will have a limited number of reducers available, but will accept no liability or obligation to provide them.

Inert Gas System: All Export Tankers must be fitted with an inert gas system and confirm that all tanks have an oxygen content of less than 8% by volume prior to loading.

(1) On request, the vessel will demonstrate the oxygen quality to the Mooring Master prior to commencement of transfer or at any time so requested during transfer.
(2) In the event of a failure of the inert gas system, immediate action shall be taken to prevent air from being drawn into the tanks. All tank operations shall be stopped and the deck isolating valve closed.

Fire/Pollution Control/Gas Detection Systems:

(1) Each Export Tanker must have its fire fighting system fully operational prior to commencing any mooring and/or transfer operations.
(2) All Export Tankers shall comply with all applicable regulations and requirements pertaining to the control of pollution of any type.
(3) All Export Tankers must be equipped with a fully operational inert gas monitoring system, which shall be in a monitoring mode (for oxygen content, pressure, etc.) prior to commencing any mooring and/or transfer operations.
(4) All Export Tankers shall conform with the International Maritime Organisation (IMO) regulations for the prevention of pollution by oil.

Loading Rate: The FPSO is capable of completing transfer of 500,000 bbls. within 36 hours, not including connection/disconnection time, providing the Export Tanker's facilities and operations permit.

Cargo/Ballast Tank Contents/Ullage:

(1) The maximum cargo oil storage capacity, both wet and dry, of the FPSO is approximately 514,000 bbls.
(2) The Export Tanker will load cargo and discharge ballast as previously arranged between the Export Tanker's Loading Master, Master and Chief Officer. This plan will be placed in written form and signed before operations commence.

Ballast Transfer:

(1) When the Export Tanker is loading, it may commence discharging clean ballast concurrently with loading only if the ballast system is completely separated from the cargo system.
(2) Export tankers having clean ballast in cleaned cargo tanks and lines are recommended to suspend loading when discharging ballast.
(3) Export tankers may only discharge ballast that is clean.
(4) The FPSO is *not* equipped to receive dirty ballast.

Loading/Ballast Operations: It is strongly emphasised that the undertaking and completion of a successful cargo transfer operation is dependent upon effective co-ordination and co-operation of all parties involved.

It is the Export Tanker's Master's responsibility to observe International Convention Laws and Angolan Government Regulations and to ensure that no crude oil, bunker C, diesel, bilges or dirty ballast is pumped or spilled overboard from his vessel whilst in the area of the Kiabo Field Marine Terminal. Drip pans should be used, especially when disconnecting hoses, in order to prevent any spillage.

Cargo/Ballast Transfer Plan: Prior to the commencement of a cargo transfer operation, the contents of each cargo and ballast tank shall be checked and recorded. The sequence of all operations during transfer of cargo to the Export Tanker shall be planned in detail with regard to personnel assignments, pumping/discharge rates, valve change over requirements, ballasting adjustments, and tank level measurements during operations, etc.

(1) Inspection of Cargo Tanks: The Export Tanker's cargo tanks are to be inspected by Sonangol P&P.
(2) Scuppers to be Plugged: Before loading commences, all overside scuppers shall be plugged and made oil-tight.
(3) Completion of Loading: Normally completion of loading is by Export Tanker's stop and any request for the Marine Terminal to stop the flow of oil at the pre-determined tonnage must be in writing. The request must include the statement by the Export Tanker's Master that the Company will not be held responsible for any error, and in the case of the vessel being overloaded, the Export Tanker's Master will be responsible for any oil spills caused by this request. Please note that under normal operations, excess cargo cannot be pumped back to the FPSO, only in an emergency will this be allowed, and all cost and delays will be to the account of the Export Tanker.
(4) Communication During Loading: All communications relative to the loading of the Export Tanker shall be routed through the Mooring Master who will remain in contact with the Marine Terminal continously via portable VHF radio communication.
(5) Failure of Communication: In the event of radio communications failure with the Marine Terminal, the Export Tanker should sound the emergency signal. Continuous blasts of the vessel's whistle will be sounded to notify the Marine Terminal of the radio communication failure. Upon hearing this signal from a loading Export Tanker, the FPSO will immediately cease loading to the Export Tanker until radio communications have been re-established.

(6) Leaking Oil from Export Tankers: If it is discovered that oil is leaking from an Export Tanker whether at anchor, deballasting or during loading, and so as to constitute a safety or pollution hazard, which is at the sole discretion of the FPSO's Master, the Export Tanker will cease operations and may be requested to leave the Marine Terminal limits. Completion of loading will only be undertaken when satisfactory evidence of repair, duly certified by the surveyors of ABS, Lloyds or DNV or another recognised classification society, is submitted.

(7) Valve Closure During Loading: *No Export Tanker valves, which stop or reduce the flow rate of oil from the pumps of the FPSO, are to be operated without prior authorisation of the Kiabo Field Marine Terminal.* It is extremely dangerous to close ship's valves against the incoming stream, such a procedure creates excessive pressure, which may damage hoses, piping or other Marine Terminal facilities. Vessels will be held responsible for damage resulting from failure to observe this precaution. The practice of throttling back on the Export Tanker's cargo manifold valves is to be avoided. If a lower loading rate is required, the Terminal is to be advised and the pumping rate will be reduced to the new agreed rate. A reduction in loading rate before topping-off a final tank or tanks may be arranged through the Mooring Master by the Export Tanker's officer-in-charge. On advice from the Export Tanker, a minimum of 3 minutes is required to stop the flow of crude oil from the FPSO.

(8) Crude Oil Overflow During Loading: Export tanker's Masters are warned that if at any time an overflow of crude oil occurs, cargo transfer operations will be suspended immediately. Loading will only be resumed when the oil is cleaned up and removed from the decks of the vessel and/or from the surface of the sea, any damage is repaired, and no further danger exists. All spillage of oil must be reported immediately to the FPSO Master. Subsequently, a detailed report, giving all relevant information, must be submitted in writing by the Master of the Export Tanker concerned to the FPSO Master. A joint survey of the Export Tanker by its Master and a Kiabo Field Marine Terminal Representative will be required.

(9) Cargo Transfer Plan:

(1) A plan of operation shall be developed prior to each cargo transfer.

(2) The plan of operation shall include, but not be limited to, the following details:

(a) Date and time of arrival of visiting Export Tanker.
(b) Weather and sea conditions anticipated at time of arrival and until Export Tanker departure.
(c) Identity, size and Master of Export Tanker.
(d) Mooring Master assigned.
(e) Cargo officer assigned.
(f) Crew/team assignments.
(g) Cargo tanks contents start/finish.
(h) Ballast tanks contents start/finish.
(i) Mooring/cargo transfer hose connection timing.
(j) Date/time for completion of pre-cargo transfer safety checks.
(k) Date/time for commencing cargo transfer operations.
(l) Detailed operational procedures.
(m) Date/time for expected completion of cargo transfer operations.
(n) Cargo transfer hose retrieval procedures – Date/time.
(o) Date/time of Export Tanker departure.
(p) Radio assignments – portable radios.

(3) All relevant information from the plan shall be transmitted to the Export Tanker prior to its final approach to the Marine Terminal.

(10) Cargo Transfer Team Familiarisation:

(1) FPSO Master shall ensure that the Mooring Master, Cargo Officer and designated Team Leaders are familiarised with and understand the requirements and details of the Cargo Transfer Plan.

(2) Mooring Master, Cargo Officers and Team Leaders shall ensure that personnel, assigned to them for the cargo transfer operation, from arrival to departure of Export Tanker, are familiar and understand the Cargo Transfer Plan.

(3) FPSO Master shall ensure that all personnel involved in cargo transfer operations have received satisfactory training in all functions for which they are, or may be, responsible.

(4) FPSO Master shall ensure that all personnel are fully familiarised with emergency shut-down procedures, along with their corresponding assignements and responsibilities. Furthermore, he shall specifically impress the need for immediate action in raising the alarm in the event of an emergency situation, such as a fire on board.

(5) No cargo transfer related operation may proceed until the Master of the FPSO is satisfied that the requirements of (1) through (4) of this section have been met.

(11) Equipment Deployment and Test:

(1) All equipment required for interconnection to the visiting Export Tanker and for normal cargo transfer operations shall be checked for operability, availability and location prior to the arrival of the Export Tanker.

(2) All FPSO equipment requiring operability, hydrostatic pressure and other tests shall be tested as specified in the Cargo Handling Manual. Specific examination, and if necessary, adjustment, repair or replacement of valve and pump glands, etc., shall be undertaken before commencing cargo transfer operations. All equipment static grounds shall be checked before commencing interconnection of the cargo transfer hose to the Export Tanker.

(3) Inert Gas System shall be checked and in operation prior to and during all cargo transfer operations.

(4) All fire fighting equipment shall be checked and fully operational before commencing any cargo transfer operations.

Dirty Ballast: FPSO "Ocean Producer" has no facilities for receiving dirty ballast. Export tankers are recommended to arrival with clean ballast.

Discharging Ballast at Night: In addition to the lights usually displayed, Export Tankers discharging ballast or loading cargo during darkness, will illuminate the area around the ship, to the satisfaction of Mooring Master, in order that any oil on the surface of the sea may be readily detected, and appropriate action taken. Export tankers unable to illuminate the sea satisfactorily, may not discharge ballast during darkness. Export tankers should provide suitable flood lights for working on deck during night operations. Export tankers equipped with separate tank system (SBT) will be allowed to discharge.

Ballast Required for Mooring: An Export Tanker must have sufficient ballast for safe manoeuvring. However, by a careful watch of the weather information, mooring, instructions and frequent exchange of information between the Export Tanker and the Marine Terminal, and by a knowledge of the behaviour of his own vessel, Export Tanker's Master may desire to come to the Marine Terminal with minimum safe ballast.

Load-on-Top or Discharge of Slops: Most responsible ship owners have adopted a system of tank cleaning using circulator methods of transfer of tank washings. The result is that no oil is discharged into the sea and the oil separated is collected to avoid pollution. With the written permission of the Export Tanker's Owners/Charterers, the Marine Terminal will load on top of such slops.

Penalties for Pollution of the Sea: The categories of pollution include crude oil, bunkers, bilges and dirty ballast or any other matter that may result in pollution of the sea. Any fines imposed for such pollution will be for the Export Tanker's account.

Concurrence on Loading Plan – Export Tanker/FPSO: Prior to commencing cargo transfer operations, the Master of the Export Tanker, the FPSO and/or the Mooring Master will confer and agree on a cargo transfer plan.

(1) The Master of the FPSO shall inform the Master of the Export Tanker as follows:

(a) Cargo specifications.
(b) Quantity of cargo to be loaded.
(c) Tank venting requirements.
(d) Maximum loading rates.
(e) Maximum pressure available at the STS connection.
(f) Stand-by time for normal pump stopping.
(g) Communication system for cargo transfer control, including the signal for emergency stop.

(2) The Master of the Export Tanker shall inform the Master of the FPSO as follows:

(a) Where the vessel has part cargoes on board, grade, volume and tank distribution.
(b) Maximum allowable loading rate and topping-off rates.
(c) Maximum allowable pressure at the cargo transfer hose connection during cargo transfer.
(d) Cargo quantities acceptable.
(e) Quantity, quality and disposition of ballast together with time required for discharge and maximum light freeboard.
(f) Quantity, quality and disposition of slops.
(g) Quality of inert gas.

Agreement on Delivery Rate/Rate of Exchange:

(1) Prior to commencing cargo transfer operations and following the exchange of information as required in Section (1) (d) and (2) (b) above ("Concurrence on Loading Plan – Export Tanker/FPSO"), agreement between the Masters of the visiting Export Tanker and the FPSO shall be established regarding:

(a) Cargo transfer initiation rate.
(b) Cargo transfer normal rate.
(c) Cargo transfer topping-off rate.
(d) Stand-by time for normal pump stopping.
(e) Time required for rate changes, zero flow to maximum agreed rate (MAR), and from MAR to zero.
(f) Masters are reminded that, for safety reasons, it is advisable to have the Export Tanker loaded as quickly as possible.

(2) Such agreement shall be confirmed in writing.

Manning Assignments/Stations Manned:

(1) Cargo Officer: The Cargo Officer shall be an officer appointed by and responsible to the Master of the FPSO. The Cargo Officer shall be empowered to make and implement all decisions relating to the cargo handling and cargo transfer operations, having the necessary knowledge and experience for that purpose.

(2) Pump Man: One or more crewmen as assigned by the Master of the FPSO to man the pumps and, when required, to operate the manifold valves. Pump men shall have the necessary knowledge and experience required for operation of pumps and valves to ensure maximum control capability, smooth operation and a minimum of pressure surge effect.

(3) Deck Men: Ship's crew members assigned as required by the Master of the FPSO or the Cargo Officer. Care should be taken, when making assignments for normal cargo transfer operations, that there is no conflict relative to any crew member's assignment under any emergency planning.

(4) Lead Man: Each group operating in the jurisdiction of the Cargo Officer shall have a lead man designated. Each such lead man shall be provided with a portable, two way radio for the purpose of relaying the Cargo Officer's commands and instructions to the respective groups. Each such lead man shall be competent in the use of a two way radio, shall be knowledgeable and experienced in the area of operations to which they are assigned, and shall be conversant with the established communications language to be utilised.

(5) Others: As deemed appropriate for the safety and completeness of any cargo transfer operations, the Master of the FPSO and/or the Cargo Officer shall assign other personnel as is considered necessary.

Concurrence on Readiness to Proceed – Export Tanker/FPSO: Prior to commencing with any cargo transfer operation, the following requirements must be completed and reported to the Master of the FPSO. Cargo transfer operations may only commence after the report has been understood, acknowledged and the Masters of both the FPSO and the visiting Export Tanker concur on the readiness to proceed.

(1) Export Tanker Personnel in Place:
  (1) Prior to commencing cargo transfer operations, the Export Tanker crew shall be at their stations as normally assigned for cargo loading operations.
  (2) All personnel assigned for radio duty, station and portable, shall have checked the serviceability/operation of their radio equipment, and shall have reported by radio as being in position and ready for the duty as assigned.
  (3) All call signs assigned to Export Tanker crew and FPSO crew sections shall be advised to and recorded by the Masters of the FPSO, the Export Tanker, the tug, the workboat and the Mooring Master.

(2) Tanks Vented: Export tanker and FPSO Masters shall confirm that the tanks are vented and that the agreed venting systems are operational and are being used.

(3) Test Flows for Leakage/Correct Valve Positions:
  (1) Prior to commencing cargo transfer operations, the Export Tanker's Master shall confirm that:
    (a) All sea and overboard discharge valves are tightly closed and sealed.
    (b) All unused connections on the manifold are closed and blanked.
    (c) That the scuppers are effectively plugged and drip trays are in position under the manifold.
  (2) During initial low flow cargo transfer, the Export Tanker's Master shall check and confirm that no leakage is apparent, and that all valves are correctly set for full cargo transfer rate operations.

Execution of Plan:

(1) All personnel shall be at their designated stations when required.
(2) All stations shall report status of equipment and personnel readiness.
(3) Mooring Master and Cargo Officer shall concur on readiness to commence cargo transfer operations.
(4) Cargo Officer shall order commencement of cargo transfer operations.
(5) Cargo Officer shall supervise operation, ordering valve change-over when necessary to ensure correct withdrawal sequence from FPSO tanks according to the Cargo Transfer Plan.
(6) When cargo transfer operations are 90%, 95%, 98% and 99% complete, Cargo Officer shall advise the Mooring Master accordingly.
(7) When cargo transfer has been completed, the Cargo Officer shall so notify the Masters of the FPSO, the Export Tanker, the tug, the workboat and the Mooring Master. He shall then order the securing of all pumps and valves, informing the FPSO Master and Mooring Master when this has been completed.

Securing from Operations:

(1) Mooring Master shall then order the closing of the butterfly valve at the Export Tanker end of the cargo transfer hose, the closing of the Export Tanker manifold valves and the disconnection of the cargo transfer hose. He will supervise the fitting of the blind flange to the cargo transfer hose prior to lowering the hose-off of the Export Tanker, the exchange of documentation and other requirements necessary to complete the operation.
(2) Prior to departure of the Export Tanker, the Master of the FPSO and the Master of the Export Tanker shall reach agreement on the quantity of cargo that has been transferred, that all required documentation has been completed, and that all operations have been secured.
(3) The Master of the FPSO shall, when satisfied that departure of the Export Tanker may proceed, provide clearance to the Master of the Export Tanker to initiate departure operations. He shall also advise the Mooring Master, the Tug Master and the Workboat Master, all of which shall acknowledge readiness to proceed with departure operations and responsibilities.

Close-Out Documentation:

Cargo Documentation: Crude oil loading documents, such as the Bill of Lading, Quality Certificate, Quantity Certificate, Dry Certificate, Ullage Report, Time Loading Report, Certificate of Origin, Cargo Manifest and Master's Receipt for Shipping Documents and Samples, are prepared at the Kiabo Field Marine Terminal.

Signing of these documents by the Master will take place at the same time as the final departure clearance formalities are being carried out.

Protest: Notes of Protest, if any, should be handed to the Mooring Master for onward delivery to the Company.

Masters are requested to pay particular attention to the fact that the Mooring Master will only acknowledge receipt of any "Note of Protest", and *is not authorised to accept* such letters.

GENERAL:

Agency: The Company does not perform any vessel agency functions. Export tankers calling at the Kiabo Field Marine Terminal must arrange for their own Agents.

Flag: Export tankers are required to fly the flag of Angola on the foremast during daylight hours while at the Terminal.

Government Officials: Government officials, such as the Customs Officer, Quarantine Officer, Immigration Officer, Captain of the Port and the Police, may be expected to visit the vessel. Should Customs guards be stationed onboard the Export Tanker while at the Terminal, it is expected that the Export Tanker will provide food for these guards and other governmental officials. Export tankers calling at the Terminal must provide an accommodation ladder for subject officials if required.

Quarantine Regulations: The rules governing the quarantine of Export Tankers are similar to those found in other parts of the world.

Roles/Responsibilities:

(1) Mooring Master shall assist with Export Tanker operations until the Export Tanker disengages from the mooring preparatory to leaving the Marine Terminal site.
(2) The Export Tanker's Master is responsible for the frequent monitoring and careful tending of the Export Tanker moorings to ensure that movement of the Export Tanker is minimised.
(3) While moored, the Export Tanker equipment and machinery essential for manoeuvring shall be maintained, ready to permit the ship movement from the mooring at short notice.
(4) Repairs or other work, which may prevent the rapid departure of the Export Tanker, should not be undertaken while the Export Tanker is moored to the FPSO.
(5) A watchman should be stationed aboard the Export Tanker to monitor the condition of the Export Tanker's mooring, to report any condition which may indicate imminent failure of the mooring, and also to report any leakage of oil.
(6) (a) In the absence of a third party cargo surveyor, the Mooring Master shall witness the ullage of all tanks onboard the Export Tanker prior to and following completion of the cargo transfer operations.
  (b) Each measurement record shall be delivered to and retained by the Master of the FPSO.

WEATHER/TIDE: *Operating Environment:*

(a) Weather conditions (20 years):
  Wind Speed: 29 knots – 41 knots.
  Wind Direction: 0° – 360°
  Significant Wave Height: 15.1 ft.
  Significant Wave Period: 13.7 seconds – 17.3 seconds
  Swell Height: 13 ft.
  Swell Period: 17.3 seconds
  Swell Direction: 180° – 225°
(b) Current Speed: 0 – 1.8 knots
  Current Direction: Primarily from 135°, can sometimes reverse.
(c) Sea Water Surface Temperature: 75°F – 85°F
(d) Mean Air Temperature: 72°F – 80°F

Argentina

ROSARIO: (Also see Page 45)

SHIPMASTER'S REPORT: July 1994 (Received October 1994).

Berth: Grain Wharf.

Cargo: Degummed soya bean oil (connection – hoses).

Gangway: Ship's accommodation ladder.

General: Port is sited 300 miles from Sea Pilot Station (River berth). Strong current. No tugs used. Ship berthed port side to. Cargo loaded via manifold and via tank hatch. No work at night or weekends, as no overtime payments sanctioned by Charterer. Max. draft 29 ft. (F.W.). Density – fresh.

Berth: Grain Terminal.

Cargo: Degummed soya bean oil (connection – hoses).

Gangway: From shore.

General: River berth 10 miles down-stream from Rosario. No tugs. Vessel berthed using offshore anchor. Strong river current at all times. Max. draft 29 ft. (F.W.). Vessel suspected of touching bottom on departure when least depth in Emilio Mitre Channel less than advised (our draft 24 ft. 3 in.) (minimum depth in channel advised as 25 ft. 7 in.).

Recommendations: Check maximum draft available for all approach channels to this port.

USHUAIA: (Also see Page 55)

SHIPMASTER'S REPORT: July 1994.

Vessel:

LOA 156 m.
Breadth: 24.7 m.
D.w.t. 18,277 tons.
Draft 7.30 m.
Vessel called to discharge and load containers.

Location: The port of Ushuaia is close to South Polar Region, and is situated at centre of the "Canal Beagle" River, approximately 54 nautical miles from the Easterly open sea pilot station.

Restrictions: Restriction limits by a line joining the following approximate positions:

(a) Lat. 54° 15′ 00″ S., Long. 66° 54.7′ W.
(b) Lat. 54° 57′ 50″ S., Long. 66° 50.9′ W.

All foreign vessels without a Pilot on board prohibited entry West of this line.

Pilotage: Compulsory. Four licensed Pilots are available at any time. Pilots usually join ship in approximate position Lat. 55° 01.8′ S., Long. 66° 49′ W.

Vessel must give Agent 48 hours notice, in order to arrange Pilot and give accurate ETA to their Agents (not to the Pilot Association). When within VHF range, vessel should communicate with the Ushuaia Pilot Boat, via Channel 16, working Channels are 14 and 12.

The Pilot boat was not at the pilot station, but at the following approximate position: Lat. 54° 53′ S., Long. 67° 20′ 30″ W. (Pto. Harberton). Pilot boat has to sail about 20 nautical miles to the pilot station. Therefore the Pilot shall be confirmed 4 hours, 2 hours and 1 hour in advance by VHF. The pilot boat "La Pampa" is easily identified, as it is painted with blue hull and white bridge and clearly marked "Pilot" and displays international pilotage signals.

Pilot Office Address: Gdor. Deloqui 304-(9410) Ushuaia. Tel:/Fax: 0901-22448.

Documents:

Customs:
- 1 copy Crew List.
- 8 copies Special Form-Deck and Engine Spares and Stores List (one original, 2 copies for Customs).
- 3 copies Crew Effects Declaration.
- 3 copies Bond Stores List.

Sanitary Officials:
- 1 copy Health Declaration.
- 2 copies Crew List.
- 1 copy Vaccination List.

Maritime Police:
- 4 copies Crew List.
- 4 copies General Declaration, issued by Agent.
- 4 copies Passenger List.
- 3 copies Drugs List.
- 3 copies Arms and Ammunitions List.

Immigration:
- 3 copies Crew List and Shore Pass issued by each crew member (photograph necessary).
- 3 copies Passenger List.

Port Authority check and sight following ship's certificates:
- Certificate of Vessel's Nationality.
- International Tonnage Certificate.
- Derat Exemption Certificate.
- Cargo Ship Safety Equipment Certificate.
- Cargo Ship Radio-Telegraphy Certificate.
- Cargo Ship Safety Construction Certificate.
- International Load Line Certificate.
- International Oil Pollution Prevention Certificate.
- Last Port Clearance.

Ship Reporting System: Compulsory system in effect for vessels, call sign "L4D".

Vessel should report:
(a) Vessel's name.
(b) Call sign.
(c) Flag.
(d) Port of departure (Inward-bound) next port (Outward-bound).
(e) Type of vessel.
(f) Draft.

Anchorage:
(A) Roadstead: Within 1.5 miles to 4.0 miles from Pta. Moat Lighthouse. There is an anchorage for awaiting Pilot.
(B) Port Anchorages:
    South Anchorage:
    (i) Lat. 54° 50.02′ S., Long. 68° 16.08′ W. (Buoy)
    (ii) Lat. 54° 50.20′ S., Long. 68° 16.40′ W.
    (iii) Lat. 54° 49.53′ S., Long. 68° 18.10′ W.
    (iv) Lat. 54° 49.72′ S., Long. 68° 18.20′ W.
    North Anchorage:
    (i) Lat. 54° 48.45′ S., Long. 68° 15.71′ W.
    (ii) Lat. 54° 48.38′ S., Long. 68° 15.90′ W.
    (iii) Lat. 54° 48.76′ S., Long. 68° 17.35′ W.
    (iv) Lat. 54° 48.65′ S., Long. 68° 17.38′ W.
    Above anchorage for awaiting berth or quarantine.

Radio/VHF: Ushuaia Radio call sign "LPC2" 512 kHz, or "LPC27" 4428.6 kHz.

VHF Channel 16, working 14 and 12 for Pilot and Port Control. Channel 69 for Agents.

Tugs: None.

In an emergency, the ship's Agent requests a tug from the Navy.

Medical: Assistance available.

Fresh Water: Available at berth.

Fuel: All grades of bunkers available from Muelle "Orion" Pier, subject to advance notice being given.

Cranes: No cranes on berth, usually use ship's cranes. Stevedore company has 2×45 tons mobile cranes and 1×30 tons truck crane.

Stevedores: Working hours: 0700 hrs. – 1900 hrs. Saturdays 0700 hrs. – 1300 hrs. Overtime if required from 1900 hrs. – 2400 hrs. and 0000 hrs. – 0700 hrs.

Gangway/Deck Watchmen: Required.

Opening/Closing Hatches: Usually by crew.

Time: Summertime: GMT minus 4 hours (from October to March).
Wintertime: GMT minus 3 hours (from April to September).

Tides: Springs about 5.2 ft., Neaps about 2.2 ft.

Identification Cards: Required.

Shore Leave: Crew members allowed ashore, but must be provided with identification cards.

Airport: Small airport with service to Buenos Aires.

Currency: U.S.$ 1.00 = Un.Peso 1.00.

Seamen's Club: None.

Australia

GENERAL: (Also see Page 60)

HEALTH: *Delete and substitute:*
AUSTRALIAN QUARANTINE AND INSPECTION SERVICE
Department of Primary Industries and Energy
Request for Pratique (Health Clearance):
Commonwealth of Australia
Quarantine Act 1908

Note: Masters or Medical Officers, who wilfully make a false statement in answers to questions A – H, are liable to a fine not exceeding $5,000 or imprisonment for a period not exceeding 2 years.

A. Name of vessel . . . .
Call sign . . . . Type . . . .
Nationality . . . .
B. Where is the vessel from? . . . .
Departure date . . . .
C. Destination . . . .
ETA first port . . . .
D. Name of next port . . . .
ETD . . . .
E. Have there been any deaths during the current voyage?
Yes No
Have there been any cases of illness during the last 21 days with a fever of 38°C or above, and accompanied by:
(a) rash, jaundice or glandular swelling,
Yes No
(b) diarrhoea lasting longer than 24 hours.
Yes No
F. Are there any animals onboard?
Yes No
G. Have you carried livestock in the last 6 months?
Yes No
If yes, list the type, ports visited and cleaning performed since last livestock voyage.
. . . .
H. Date of Derat/Derat Exemption Certificate?
. . . .
I. Ballast Water:
Do you intend to discharge ballast while in Australian waters?
Yes No
If yes, have you:
(a) Exchanged ballast water at sea during the voyage and have logbook certification of time and co-ordinates when re-ballasting occurred:
Yes No
OR
(b) Is your vessel part of a compliance arrangement for ballast water control accepted by the Australian Quarantine and Inspection Service?
Yes No
J. In the past 2 years, has your ship been in a Russian Far East port/s between 40° N. and 60° N. during any period between July and September?
Yes No
(a) If YES, since your last visit to the port/s, has your ship been inspected and cleared as being free of Asian Gypsy Moth by agricultural authorities in Australia, Canada, New Zealand or the U.S.A.
Yes No
(b) If NO, during your last visit to a Russian Far East port, did you obtain a certificate issued by the Russian agricultural authorities certifying that they had inspected the ship and found it free of Asian Gypsy Moth egg masses?
Yes No

Shipping Agency Name: . . . .
Signature and Date: . . . .

Note: The granting of Pratique to a vessel does not release it from being subject to quarantine. Goods require separate clearance.

CARNARVON:
This entry supersedes the entry on Page 84.

(B) CAPE CUVIER: 24.13 S. 113.23 E. (See Plan)

LOCATION: Cape Cuvier is situated on the N.W. coast of Australia approximately 75 km. N.N.W. of Carnarvon.

PORT LIMITS: This port is now incorporated in the Port of Carnarvon the limits of which have been extended as follows:—

"A line due West for 4 nautical miles from a point on the mainland in Lat. 24° 10′ S. and Long. 113° 26′ 4.5″ E., and thence in a S.S.W. direction to Cape Ronsard at the North End of Bernier Island" and then as for Carnarvon to the starting point.

DOCUMENTS: The following documents are currently required and must be completed prior to arrival and sailing.

Form 42A:	Ship's Stores Consumed in Australia.
Form M&S–11 (2 copies):	Crew List.
Form W080:	Boarding Report.
Form 5:	List of all Articles Owned or in Possession of Master, officers and crew.
Form QA4:	Quarantine Notice.
Form QA5 (if required):	Ship Master's Bond.
Form F Q360:	Primary Health Report.
Ship's Stationery:	Crew List.

APPROACHES: Red Bluff about 12 miles North of Cape Cuvier can be picked up by radar at a distance of about 20 miles. Cape Cuvier is easily identified by large white salt hill.

The berth is floodlit at night when a vessel is being loaded.

PILOTAGE: Facilities provided by vessels for Pilot boarding at Cape Cuvier must comply strictly with SOLAS regulations in all aspects.

Pilot, supplied by Dampier Salt Limited, will board approximately 1 mile North of jetty-head.

Any delays to vessels berthing due to non-compliance with Solas regulations (IMO current resolutions) will be for Owner's account.

Guidelines for all ships calling at Cape Cuvier: From past experience we have found it necessary to insist that all vessels intending calling at Cape Cuvier must supply plans showing winch layouts and deck machinery. In the case of older type vessels it is in the Owner's interest that the Pilot checks the vessel before arrival. The best way to organise this is to send the plans of the vessel's winch configuration to the Pilot (via Dampier Salt Limited) for approval.

The winches are the controlling factor and must be in first class working condition. There must be no rust on the brake drums and all brake linings must be renewed and to be of non-asbestos material. If the vessel is old it may be necessary to machine the brake liner so that the brakes will grip. The worm drive brake lever must be free and greased and be able to apply considerable pressure on the brake linings without running out of thread.

The winch reels must be capable of taking 250 m.×80 mm. rope on vessels over 30,000 d.w.t. and 250 m.×70 mm. for vessels under 30,000 d.w.t. A minimum of 2 drums each end and for vessels under 30,000 d.w.t., and a minimum of 4 drums each end (but would prefer 6) on vessels over 30,000 d.w.t.

The winches must be capable of supplying full power for long periods so steam or hydraulic lines and associated machinery must be in first class working order.

Remember: The condition of the winches control the safety of the vessel while in berth.

The leads must be good with all rollers working. The 2 centre winches are used for 266 m.×36 mm. wires so they must have provision for securing the wire to the side of the drum. Roller leads (aft only) must have a 75 mm. top bar to prevent the wires from jumping off the rollers when the vessel is trimmed by the stern.

The Pilot will remain on board for the entire loading and will be responsible for moving the vessel in the berth. Good accommodation with toilet and shower facilities and meals must be provided.

ANCHORAGE: Recommended anchorage is in position with the jetty bearing approximately 200° (T) at a distance of 1.5 miles. Depth at anchorage is about 15 fathoms. 3 cables off the shore, the depth is about 9 fathoms. Holding ground is good.

RESTRICTIONS: No berthing at night. Also see "Pilotage".

MAX. SIZE: Vessels of 70,000 d.w.t. call on a regular basis. Depth alongside is 17.80 m.

HEALTH: In the case of each vessel arriving from overseas the following information must be sent to the Port Health Authorities between 12 and 24 hours before arrival, addressing the message to the relevant shipping agency (a copy of which message is required to be sent also to Dampier Salt Limited (Telex No. 99283)):

1. The expected hour and date of arrival of the vessel.
2. Confirmation that the Master has individually inspected all persons on board within 24 hours before arrival.
3. Particulars of any cases of serious illness on board.
4. Confirmation that all persons on board are satisfactorily vaccinated against cholera and in possession of valid Vaccination Certificate.
5. Request for permission to enter Port.

On receipt of quarantine message, Dampier Salt Limited, will advise anchorage position if vessel is not berthing on arrival.

Vessels must also ensure International Quarantine signals are displayed at all times until cleared by the Quarantine Officer (Clearance will be issued via Shipping Agency).

Whilst berthed at Cape Cuvier all food and organic waste must be kept in efficiently sealed containers and frequently doused with a soluble disinfectant. No garbage may be thrown overboard.

RADIO: Perth Radio.

Weather Broadcasts: Vessels are advised to listen to daily weather broadcasts by:

1. Perth Radio (VIP) at 0100 hrs. GMT and 1200 hrs. GMT, on 484 kHz, 8597 kHz, 12294 kHz or at 0200 GMT and 1000 GMT on 16947 kHz or 22315 kHz.
2. Local broadcast by VHF Channel 24, twice daily. Broadcast is via Perth Radio.

Vessels Arrival Requirements: Cape Cuvier is a First Port of Entry and all vessels bound for the berth are required to radio to Dampier Salt Limited, Telex No. 99283 (Fax: 414029. Cables: 6 CDPR SALT C), through the normal recognised coastal radio station, i.e. Perth Radio VIP the following information additional to Port Health messages (See "Health"):

1. Upon departure from previous port, estimated time of arrival and whether or not the port is the first port of call in Australia.
2. 10 days before intended arrival at the port, the estimated time of arrival and whether or not the port is the first port of call in Australia.
3. 7 days before intended arrival at the port, confirmation or any variation of the advice previously given.
4. 4 days before intended arrival at the port, confirmation or any variation of the advice previously given.
5. 48 hours before intended arrival at the port – estimate time of arrival at the Pilot boarding ground and also advise the vessel's estimated draft fore and aft.
6. 24 hours before intended arrival confirmation or any variation of the advice previously given.
7. 12 hours before intended arrival, final confirmation of time of arrival.

Note: Because of the isolated location of Cape Cuvier and the need to organise transport for the various berth services it is imperative that ample notice is given on arrival times. This is particularly so for weekend arrivals. Failure to adhere to these requirements may jeopardise vessels berthing to the detriment of Owner's account.

VHF: Call sign: Cape Cuvier. Available frequencies: Channels 6, 8, 12, 16, 67. Loading Operation Frequency: 155.97 MHz. Emergency Working Frequency: Channel 67.

A continuous watch must be maintained by the vessel on VHF Channel 16. All vessels approaching the Port or at anchor must maintain a continuous watch on this frequency. *Disregard of this requirement is a contravention of Berth By-Laws and may adversely affect expeditious berthing.*

TUGS: A contractor operates the tugs and line launches which are available at all hours.

The following craft are available to assist in berthing and unberthing.

Line launch – "Bigidda". Length 16.7 m. Twin screw.

Tug "Pilbara Neptuna". Bollard pull 28 tonnes. Length 26.41 m., breadth 9.3 m. Main engines: 2×Dilhatsu eight cylinder at 950 BHP each. Twin screw "Z" peller.

"Boolathana" – tug. Bollard pull 25 tonnes. Length 24 m., breadth 8 m., draft 3.4 m. Main engines: 2×V12 Caterpillar 398 1,400 r.p.m., 850 b.h.p. each. Twin screw kort nozzles.

BERTHING:

Salt Loading Berth: Situated at Lat. 24° 13′ S., Long. 113° 24′ E. The berth is used only for salt loading.

A central timber decked wharfhead carrying a fixed position, stiff arm, slewing and luffing conveyor boom shiploader with deflector.

Six mooring buoys anchored to the seabed.

Vessels moor to buoys and warp themselves into position for loading each hold. The shiploader generally has the capacity to load 2 adjacent holds for each warped position of the vessel.

The principal berth dimensions are as follows:

Natural seabed level: R.L. – 17.8 m.

Minimum distance between vessel and jettyhead structure: 14.5 m.

Berth length 670 m. between fore and aft mooring buoys Nos. 2 and 5.

Berth width 180 m., between breasting mooring buoys Nos. 3 and 4, and minimum vessel stand-off from jettyhead (14.5 m.).

R.L 0.0 m. is Indian Spring Low Water at Cape Cuvier. The maximum tidal range at Cape Cuvier is 1.7 m.

The principal shiploader dimensions are as follows:

Jettyhead area:	18 m.×18 m.
Jettyhead deck level:	R.L. 13.2 m.
Shiploader boom underside:	R.L. 16.2 m.
Shiploader boom outreach:	Approx. 30 m.
Shiploader boom luff:	incline 45° decline 15°
Shiploader boom loading arc:	incline 18° decline 15°
Shiploader boom slew:	± 90°
Shiploader boom conveyor width:	1,600 mm.
Shiploader boom conveyor speed:	3.1 m./sec.
Shiploader boom conveyor capacity:	3,500 t.p.h.

Also see "Loading".

MOORING: *Ship's Mooring Lines:*

1. Vessels shall provide the following lines:

6×250 m.×80 mm. diameter polylines on forecastle deck.

6×250 m.×80 mm. diameter polylines on afterdeck (in case of vessels under 30,000 d.w.t., 70 mm. to apply).

All lines to have a reinforced soft eye, 1 m. long in the outer end.

2. All vessels shall provide satisfactory ship's lines on both fore and after decks, such to pick up the 36 mm. diameter steel wires, 2 from each mooring buoys Nos. 2 and 5.

3. All working and spare lines supplied by the vessel are to be in first class working condition.

Note: If vessel cannot supply lines, Dampier Salt Ltd. will supply at no cost.

Mooring Equipment – Supplied by Dampier Salt:

1. Dampier Salt shall supply 2×265 m.×36 mm. diameter steel wires from each of mooring buoys Nos. 2 and 5. These lines are to be run back to the vessel and secured on drum winches to act as the fore and aft longitudinal mooring lines.

2. Dampier Salt Limited shall supply all ropes necessary for stopping-off polylines.

Berth Operating Conditions: Unless the Pilot otherwise directs, berthing operations will generally be restricted to the following conditions:

Winds: Zero winds from Northern quadrants and below 25 knots within the Southern sector between East and West.

Swells: Up to a mean amplitude of 2 m. as recorded on the berth wave rider.

Ballast: The vessel to maintain ballasted state with the propeller 75% immersed and a stern trim.

Berth Occupancy: Unless the Pilot otherwise directs, berth occupancy will generally be restricted to the following conditions:

Winds: Below 35 knots from the Southern quadrants. Below 10 knots from the Northern quadrants.

Swell: Up to a mean amplitude of 2.5 m. as recorded on the berth wave rider.

Mooring Procedure:

1. Preparation before Berthing – Two central drums, both fore and aft, are to be left bare ready to receive the 36 mm. diameter wires when these wires are landed on board from mooring buoys Nos. 2 and 5.

2. On berthing – Immediately prior to berthing, a number of shore based personnel will board the vessel to assist in handling lines during berthing. As instructed by the Pilot, polylines will be run out as both breasting lines and to pick up the steel wires from the fore and aft mooring buoys. Polylines unable to be held on drum winches will be taken up on warping winches, stoppered off and placed on bitts.

The Pilot will give instructions as to how much tension is to be applied to each line.

3. On Warping – During the shiploading operation, it will be necessary to shift the vessel such that the shiploader can load the vessel in accordance with the loading schedule. Normally, the shiploader will load only two hatches from the one positioning of the vessel.

The shore-based personnel will board the vessel to assist in line handling for the warping operation. The tugs will also assist as required.

Under the direction of the Pilot, lines shall be played out or taken in such to warp the vessel to the next loading position.

4. On unberthing – All lines shall be dropped or taken in as instructed by the Pilot. The shore personnel will assist in line handling.

LOADING:

Condition to Load Salt:

1. Ensure that vessel's holds are thoroughly washed and all traces of the previous cargo are removed.

2. Ensure that vessel's holds are thoroughly lime washed with slaked lime (calcium hydroxide – $Ca(OH)_2$ and that no other substances are mixed with it.

Note: Limewashing is a pre-requisite of vessel's loading.

In the event that holds are not acceptable, the Master may be required to sign a "Letter of Indemnity" accepting the cargo on behalf of the Operating Line, acknowledging that holds are in the condition described in the report by the independent Marine Surveyor.

Provided the vessel's holds are acceptable to the Surveyor as being "clean" the Surveyor will issue a Hold "Cleanliness Certificate".

3. Ensure that mooring lines are laid out in readiness for berthing in accordance with "Mooring Procedure".

Loading Procedure: The vessel is to ensure that the first 2 holds to be loaded have the hatch covers removed on berthing. On berthing the vessel will be positioned by the Pilot, such that the loading can commence immediately upon acceptance of the Notice of Readiness and verification that vessel's holds are clean to standards set by Dampier Salt Limited.

An independent Marine Surveyor appointed by Dampier Salt will agree all draft readings and ballast soundings with the Chief Officer prior to commencement of loading.

An Operations Supervisor from Dampier Salt Limited will board the vessel prior to berthing to check that the vessel is ready to load. This Officer will agree with the Chief Officer a loading sequence, loading schedule, warping procedures, draft problems (if any) and any other matters relating to the loading of the vessel. Warping procedures shall be confirmed with the Pilot.

The Operations Supervisor will draw up a loading schedule, after consultation with the Chief Officer, nominating the approximate hold loading duration, times of warping and the estimated time of completion of loading, and sailing time.

The Operations Supervisor will normally remain on board the vessel for the duration of loading in order to liaise with the Chief Officer on matters concerning the loading procedures.

A belt weightometer is used by Dampier Salt Limited to indicate loading rates and tonnages loaded in each hold. This instrument has an accuracy of ±1.5%. It is the practice of Dampier Salt Limited for the Surveyor and Chief Officer to agree a preliminary draft survey when the second last hold is approximately 80% loaded. This survey then allows the correct loading of the remainder of the cargo so as to ensure correct trim and prevent inadvertent overloading. The final loaded cargo tonnage is determined by draft survey, calculated by and agreed between the Surveyor and Chief Officer.

No labour is available at Cape Cuvier to board the vessel for any shipboard duties other than handling of mooring lines. Trimming is by conveyor discharge at the end of the loading spout only.

Salt – General Specifications: Stowage factor of Salt. Normal stowage density 32 cu.ft. per long ton or 0.89 cu.m. per metric tonne. Angle of repose 33°.

STEVEDORES: Dampier Salt Ltd.

MEDICAL: Master to advise by telex via coastal radio if any crew members require medical or dental services. Prior advice will generally ensure adequate arrangements can be made to accommodate such requests. Insufficient notice, or advice only on berthing may jeopardise the chances of obtaining normal medical/dental treatment. Emergency medical treatment is normally available through Carnarvon Regional Hospital.

DENSITY: 1025.

FRESH WATER: Not available.

FUEL: Not available.

REPAIRS: There are no ship repair facilities. However, vessels may carry out repairs of a limited nature but only with the prior approval of Dampier Salt Limited and the Harbour Master.

DRY DOCK: None.

WATCHMEN: No shore watchmen available.

HATCHES: To be opened/closed by ship's crew.

CUSTOMS ALLOWANCES: 200 cigarettes in opened carton, or 0.25 lb. cigars, or 0.5 lb. tobacco, and one opened bottle spirits per crew member.

An Australian Customs Boarding Officer is resident in Carnarvon. Regulations of Australian Department of Customs and Excise apply to the Port.

CARGO GEAR: Not required. Salt loading is by conveyor belt.

REPATRIATION: Road connection to Carnarvon, which is 97 km. distance from Cape Cuvier, thence air connection with Perth where international flights available.

AIRPORT: Carnarvon has a daily air service to Perth. Connecting flights for other Australian cities and also for overseas destinations are available from Perth.

TIME: See "General" before first port.

GENERAL: Port is gazetted under Western Australian legislation and controlled under Ports and Harbours Regulations.

Ordering Stores: Telex advice of any and all stores and provisions requirements should be given to Agent at least 4 days prior to arrival. Stores orders received later than this may not be able to be filled.

Charts and Publications:

Australian Pilot Volume V
Australian Chart AUS 329 (N.W. Cape to Pt. Cloates)
Australian Chart AUS 330 (Pt. Cloates to Quobba Pt.)
Australian Chart AUS 331 (Quobba Pt. to Geraldton)
British Chart BA 1055 (Bedout Island to Cape Cuvier)

Access to Vessel:

At Anchorage: Whilst at anchorage, access will be by authorised personnel only from the line launch or one of the tugs.

In Berth: Whilst in berth, access will normally be by a hydraulically operated gangway. On these occasions the shiploader supervisor will direct the timing and positioning of the shiploader boom such to minimise inconvenience to the shiploader operation.

Vessels Engines: Vessel's engines are not to be demobilised whilst the vessel is in berth. Adverse weather conditions affecting the area may require the vessel to be moved. Vessels in the berth will be on notice to shift at all times.

OPERATOR: Dampier Salt Limited, Lake Macleod Division, P.O.Box 501, Carnarvon, W.A. 6701. *Tel:* (099) 412677. *Telex:* AA 99283. *Cables:* 6CDPRSALTC. *FAX:* (099) 414029.

AUTHORITY: Department of Transport, 2 Essex Street, Fremantle, Western Australia 6160. *Tel:* 335-0888. *FAX:* (09) 335-0850. *Contact:* Superintendent of Pilotage.

AGENT: See "Fremantle".

GRIFFIN VENTURE: 21.13 S. 114.39 E.

LOCATION: The Griffin Oilfield is located in the Indian Ocean off the Northwest coast of Western Australia.

"Griffin Venture" is located in position Lat. 21° 13′ 24″ S., Long. 114° 38′ 40.4″ E.

ANCHORAGE/RESTRICTIONS: The off-take vessel shall not anchor in the exclusion zone. The exclusion zone is centred on the facility and extends in a 5 nautical miles radius around it. It also extends 1 nautical mile either side of the sub-sea natural gas pipeline.

The co-ordinates specifying the pipeline's route are:

Latitude	Longitude
21° 13.4′ S.	114° 38.7′ E.
21° 14.4′ S.	114° 39.2′ E.
21° 28.6′ S.	114° 47.2′ E.
21° 32.2′ S.	114° 49.0′ E.
21° 42.8′ S.	114° 49.4′ E.
21° 45.0′ S.	114° 50.4′ E.

RADIO/VHF: The Terminal will use VHF Channel 72 as a working frequency.

TUGS: None.

There is a small workboat available for line handling and floating hose work only.

MEDICAL: Facilities are not available. In emergency, medical evacuation to Karratha can be arranged, which may take 4 hours.

FRESH WATER: Not available.

FUEL: Not available.

REPAIRS: Repairs are not permitted whilst moored to the facility.

TIME: GMT plus 8 hours.

SHORE LEAVE: Not possible.

SHIPMASTER'S REPORT: September 1994.

The "Griffin Venture" is a Floating Production and Storage Unit in position Lat. 21° 13.4′ S., Long. 114° 38.6′ E., about 30 miles from the coast of Western Australia.

Helicopter service is from Dampier, about 100 miles (approximately 1 hour flying time).

Normal production of crude oil is about 80,000 bbls. per day, though this could be increased by opening additional wells. The Terminal also exports gas by pipeline to the shore.

The maximum size of ship accepted by the Terminal has been 150,000 d.w.t. There have been 33 export cargoes loaded at the facility since it's opening in January 1994.

Agents were from Dampier. A representative of the Agency flies out to the "Griffin Venture" and boards before berthing. The Agent remains on board until departure.

Radio Pratique is sent to Agents using standard format. SBT ballast was reduced to half tank level and refilled twice at sea prior to arrival.

Customs can board on arrival at "Griffin Venture", though probably will not attend on a regular basis.

Port entry requirements are as normal for Australian ports. Customs require fax of Crew List and ship's details 48 hours prior to arrival (See Form below).

Port Dues and Marine Oil Pollution Levy are not collected at the facility.

On arrival, contacted "Griffin Venture" on VHF Channel 16 with Channel 72 as working channel. Ships are required to remain at least 5 miles off the facility until instructed to proceed closer for berthing. Ship stopped and drifted – rate of drift about 1 knot in S.E.'ly direction (September).

Berthing is carried out from 0700 hrs. until 1630 hrs.

Berthing Master and 2 assistants (plus Agent, Surveyor (SGS) and Customs) board by launch using combination ladder when ship is about 1 mile astern of the "Griffin Venture". A wave rider buoy is moored about 1 mile S.W. of the facility. It is a small orange buoy with a light, radio aerial and several floats, about 75 m. from it. The facility did not advise the ship of its presence and it is not marked on the charts.

Berthing is carried out as for normal SBM practice. The messenger line and pick-up rope are wound on to mooring winch drum and the chaffing chain is secured in AKD bracket. Only one chain is available with SWL of 200 tonnes. The pick-up rope is a 72 mm. polyproylene.

Distance off and speed are relayed to the Berthing Master from the assistants on the fo'c'sle and from the stern of the "Griffin Venture". The "Griffin Venture" has a radar gun for speed and distance off measurement.

The hose connection is to the port side and is a 16 in. line with Camlock securing arrangement.

One mooring assistant remains on the fo'c'sle throughout the time the ship is secured to the "Griffin Venture". Communication between the bridge and fo'c'sle is by VHF Channel 72. Engines are required to maintain station astern of the facility and can be required to run for prolonged periods at dead slow astern (In our case we had the engines running continuously from 1715 hrs. until departure the next day at 1136 hrs.

The second mooring assistant supervises the lifting and securing of the cargo hose.

Normal OBQ inspection is carried out by the surveyor. Cargo density is given on basis of previous lifting from facility. Density advised prior to loading was 0.7571 at 15°C, loading temperature 83.75° F and API 55.3; actual was 0.7596 at 15°C, 83.5°F API 54.70.

No Safety Check List was presented from Terminal, so ship used own from ISGOTT, and mooring assistant countersigned same.

Loading is started as soon after connection as possible. The initial flow from the cargo hose is water and it is preferred that this is loaded into only one tank. The cargo is started at minimum rate of about 1,000 cu.m./hr. until it is established that all is correct onboard, then it is increased to a maximum rate of 4,000 cu.m./hr. Loading rate from the facility varies, depending on the amount of cargo available and the amount of ballasting the facility requires to do during the loading.

Contact is maintained by UHF radio to the "Griffin Venture" Control Room, and also on VHF Channel 72.

Slowing and stopping cargo is almost instantaneous. On completion of loading, a water plug is again pumped through the hose. It is preferred if it can be to the same tank as the initial plug. Terminal did agree to their stopping cargo on their meter, but compared readings with ship as neared completion.

As soon as loading is complete, the hose is disconnected, then the ship unmoors. The 2 mooring assistants carry out the unmooring.

After unmooring, cargo survey is carried out, and on completion of calculations the personnel depart.

EDP is used by the facility. The final density is given as soon as possible after the loading is completed. The ship's figures are used for the Bill of Lading. Due to the swell conditions, a Letter of Protest must be given to the facility for using the ship's figures and for the ship's movement during taking the ullages. Mooring assistant signs same on behalf of facility Master.

No boarding by helicopter is envisaged for this facility. Helicopters to and from facility are arranged as required. Cost varies, but is about A$8,000 to A$10,000.

No stores or shore assistance is available at the facility.

Spares and stores were picked-up by launch at Dampier. Bonded stores could be available, but Customs will consider on case by case basis. All stores and provisions are brought from Fremantle, and at least 48 hours notice is required. Quality and cost of provisions good, and most items are available. Stores are delivered in a small container which must be unpacked and returned to the launch.

Additional charts which were required are AUS.327, AUS.328, AUS.415 and AUS.744.

Weather criterion for mooring and for ships to be released from the facility is wind speed 35 knots and swell height about 3.0 m. There is also a tension monitoring device on the mooring and 3 alarms require the ship to be slipped.

Mooring does also depend on the sea condition and the ability of the "Griffin Venture" to launch her boat.

BHPP have a fixed criterion for unmooring ships and the "Griffin Venture" in the event of a cyclone being in the vicinity. Cyclone season is from October through to April.

Customs:

AUSTRALIAN CUSTOMS SERVICE

SHIPS ARRIVAL DETAILS

The vessel .... departed ...... on (date) .....
and will arrive at .... on (date) ...... at . . . hours.

SHIPS PARTICULARS

1. Previous Name: .... 2. Vessel Type: ....
3. Port of Registration: .... 4. Official Number: ....

SYDNEY: (Also see Page 152)

SHIPMASTER'S REPORT: October 1994.

Documents: On our most recent visit to Sydney, which was our first port of arrival, the following documents were required by Australian Customs:
2 copies 3A – Crew Report (cover sheet).
2 copies 3B – Crew List.
2 copies Form 5 (Part one) – Ship's Report of Arrival.
1 copy Form 5 (Part two) – Crew Effects Declaration.
1 copy Form 5 (Part four) – Report of Ship's Stores.
1 copy Vessel Pro-Forma.
3 copies Ports of Call List.
3 copies 2A – Passenger Report (if required).
3 copies 2B – Passenger List (if required).

Bahamas

SOUTH RIDING POINT: (Also see Page 172)

(See Late Plans)

The sections under the headings below should be replaced with the following:

DOCUMENTS: Incoming:

Prepared by Ship:
5 Crew Lists.
3 Stores Lists.
3 Crew Declaration forms (Signed by all on board).
4 Copies of Bills of Lading.
3 Cargo Manifests.

In addition the ship will have to supply a clearance from last port of call, Derat Certificate, vaccination lists and the usual ships papers viz: Register, Safety Construction, Radio, Safety Equipment, Load Line Certificate. Oil Record Book must be up to date and available for inspection.

All vessels must have a valid certificate of insurance or other financial security in respect of civil liability for pollution damage.

Prepared by Agent:
1 Copy of Maritime Declaration of Health.
2 Copies of Inwards Report.

Customs and Immigration: After pratique has been granted, an immigration and customs inspection is carried out. The Master will be required to furnish particulars including:
(a) Name and nationality of vessel.
(b) Last port or ports of call.
(c) Nature of cargo.
(d) Number of crew.
(e) Port of destination and name of Agent.
(f) Number of days since departure from last loading/unloading port.

Copies of the Crew List and stores remaining on board will be required before clearance is granted.

Masters of vessels must take every precaution to ensure that no drugs, wine or alcoholic liquors are supplied, sold or conveyed to any person at the terminal.

Outgoing:

Prepared by Agent:

4 Copies of Outward Cargo Manifest.

2 Copies of Outwards Report.

Port Clearance Certificate.

In order to comply with Immigration regulations, crews should be checked before sailing and any missing seaman reported to the Agent. In the case of seamen left ashore for any reason, Masters are requested to furnish a letter accepting responsibility for all expenses incurred, advances if any, and instructions for repatriation.

Documentation and Clearance:

Documentation on completion of cargo operations is normally attended to prior to the vessel vacating the berth. In cases where excessive documentation is anticipated a vessel may be asked to leave the berth to complete this standing off. In such cases launches would be made available to transport documents and personnel in order to expedite the vessel's departure.

APPROACHES: Vessels approaching South Riding Point from the Eastern entrance of Northwest Providence Channel are recommended to make departure from Great Stirrup Cay Lighthouse Gp. Fl. (4) 15 sec. 14m. and head directly for South Riding Point Terminal.

Preliminary extensive soundings by U.S. Hydrographic Department indicate no underwater obstructions up to 100 fathom line within Northwest Providence Channel.

An observation airship/balloon is sited just North of the Terminal in position: Lat. 26° 38′ 00″ N., Long. 78° 14′ 22″ W.

It is clearly visible from seaward, painted white and at night a bright Qk. Fl. strobe light marks position. When in use it rises to a distance of 10,000 ft. above the ground.

A conspicuous parabolic dish antenna is situated in position: Lat. 26° 37′ 30″ N., Long. 78° 17′ 58″ W. The antenna has a face diameter of 85 ft. and maximum height above sea level is 134 ft.

The large buff-painted oil storage tanks are visible behind the sea island. The terminal frontage is backed with pine trees and scrub.

Lights: A light, Fl.R. 3 seconds, is exhibited from a height of 140 ft. above sea level on top of the sea island control building on the central platform, whilst Nos. 1 and 6 mooring dolphins are marked by quick flashing red lights.

Two leading line (range) towers mark the 300 ft. wide approach channel centre line. Lights with clear lenses, each 2.5 seconds flash, 0.5 seconds eclipse, are exhibited from the top of the towers at elevations of 39.4 ft. and 53 ft. The towers are located at Lat. 26° 37′ 21.7″ N., Long. 78° 13′ 10.2″ W., and Lat. 26° 37′ 22.8″ N., Long. 78° 13′ 11.5″ W. respectively. Daymarks are attached as follows:

Leading mark: A 9 ft. triangle at the base of the tower.

Rear mark: A 9 ft. × 6 ft. diamond immediately below the light.

Both marks are painted with 'dayglo' orange.

Buoys: Red and Black Buoys mark the outer channel entrance to the inner harbour whose light characteristics of red and green respectively are each 2.0 seconds flash, 2.0 seconds eclipse.

Three white buoys with white lights mark the 50 ft. contour.

ANCHORAGES: Anchorage or the lowering of anchors is prohibited at the Sea Island berths.

RADIO: Vessels loading for South Riding Point should communicate ETA date to the terminal immediately after clearing loading port.

Variations of this original ETA date should be communicated throughout the voyage.

Vessels proceeding to South Riding Point Terminal to load should communicate their ETA immediately upon clearing departure port.

All vessels should upgrade ETA's 72, 48 & 24 hours prior to arrival and should transmit the information laid out in "Appendix VII" at least 36 hours prior to arrival.

VHF: Station "South Riding Point Shore Control" located at the terminal is equipped with VHF radio maintaining continuous watch on Channel 16. After making successful contact, vessels will be required to change to a working frequency, where information will be exchanged regarding berthing, manifold connections, quantity of ballast and deballasting time required.

The terminal is also equipped with approved intrinsically safe VHF walkie-talkie radio sets and vessels will have this additional communication with the terminal after boarding by the Berthing Master.

TUGS: 2 × 4,200 h.p. diesel tugs are stationed at the terminal. Each tug has a bollard pull of 50 tons. Additional tugs are available to handle large size vessels.

All tugs are equipped for fire fighting and can deliver water at the rate of 2,000 gallons per minute through direct or fan spray nozzles. The tugs have foam making and oil dispersant equipment.

The tugs are owned and operated by South Riding Point Holding Ltd. Conditions of hire are given in Appendix II.

Small Craft: The terminal has one diesel engined personnel/general purpose carrier for up to 25 persons and 2 smaller boats. Both of the latter are equipped for anti-pollution duties. Launches are available for hire when operationally convenient.

Small Craft Landing: A landing is situated on the West side of the platform of the oil berths and there are additional landing stages at mooring dolphins Nos. 1 and 6.

BERTHING/UNBERTHING: *Responsibilities:* In all circumstances, the Master of any vessel shall remain solely responsible on behalf of his owners, for the safety and navigation of his vessel.

Tugs: Tank lids and openings should be securely closed before tugs are made fast. Tug utilisation in berthing operations will be as required by the Berthing Master who will meet the vessel in position as directed off the sea island. Masters of calling vessels are reminded of their obligation to comply with statutory pilot ladder rules and associated safe access regulations

Mooring System: The Berthing Master will advise the Ship's Master of minimum mooring requirements. Usual moorings consist of 2 springs, 3 breast and 4 head/stern lines at each end.

The berths have double and triple quick release hooks of 150 and 100 tons capacity. Mooring and berthing dolphins have electrically operated capstans with 2 ton line pull at 100 ft. per minute in association with mooring assemblies. Messengers are provided on all mooring dolphins.

Ship Connection: The positioning of the vessel's deck manifold in relation to the loading arms on the berth must be carried out to a close tolerance to the requirements of terminal personnel and as directed by the Berthing Master.

Loading arm connection will be made to ship's manifold by the sea island crew with assistance from ship's personnel.

Independent oil measurement representatives will attend for ullaging and sampling and/or inspection of cargo tanks in vessels discharging or loading.

Unberthing: Tug attendance and numbers will be dependent on weather conditions and on the advice of the Berthing Master.

BERTHING FACILITIES: The Sea Island has two berths interconnected for tanker to tanker transfer and to the shore tanks and inshore berths by 2×36 in. diameter submarine lines. One line for ballast/slops and another for crude.

The island is 1,470 ft. long with a central platform 48 ft. above datum and 3 mooring dolphins 25 ft. above datum on each side.

There are 4 fixed and 4 oscillating foam/oil dispersant monitor units on the platform.

The berths have a sacrificial anode cathodic protection system and ships that have an impressed voltage cathodic protection system should turn it off in the vicinity of the sea island.

Berth No. 1: Tankers of 50,000 to 500,000 d.w.t. can dock at this outer berth which is equipped with a self levelling and articulated gangway and 4×16 in. diameter Chicksan loading arms with quick release couplings in sizes 16 in., 14 in. and 12 in. diameter.

Water depth at the berth is 100 ft.

Berth No. 2: Tankers of 35,000 to 100,000 d.w.t. with a max. LOA of 900 ft. can dock at this inner berth which is equipped with a self levelling and articulated gangway and 4×12 in. diameter loading arms with quick release couplings.

Water depth at the berth is 85 ft.

Small Boat Harbour: This harbour is at the S.W. corner of the inner harbour and has a water depth of 25 ft. The harbour is used by the Company's tugs and small craft.

LOADING/UNLOADING: Cargo transfer operations are carried out on VHF Channel 74.

Procedure: Once the vessel is secure, the Berthing Master, who also acts as Loading Master, will advise the Master and Chief Officer of their cargo programme and discuss the vessel's ability to comply. Any adjustments will be mutually agreed at this stage and be reflected on the Loading/Discharging instructions which the Master will sign.

Ballast Water: Ballast water can be received in the terminal oil and water separation tanks through one of the submarine or onshore lines at rates of up to 5,000 t.p.h. On no account may ballast water be otherwise discharged in territorial waters, unless vessel has segregated ballast system. A charge is levied on all slops and ballast received ashore.

Dirty ballast and slops from ships' cargo tanks which, on the previous voyage, carried product including fuel oils or any crude requiring heat, cannot be accepted ashore. In such cases, vessels must arrive with clean ballast for shore reception.

During ballast operations at the berths, strict observance of rules and regulations governing the opening of sea valves is necessary and in correct sequence with ballast pump commencement to eliminate the risk of oil spills. Vessels may be required to ballast concurrent with discharge and throughout all cargo operations, maintain draft and trim conditions consistent with prevailing weather conditions, on the advice of Berthing Master.

Control: A responsible Ship's Officer is required to be on duty continuously.

The Terminal Operators in the control buildings offshore and onshore continuously monitor the cargo transfer rates and status of the onshore tanks or shuttle tankers receiving cargoes direct from VLCC's. The Ship's Officer will be advised immediately of changes necessary in the pumping programme.

The Terminal Operator in the offshore control room will activate all cargo movements from the tanker's manifold to or from shore tanks/receiving shuttle tankers.

Mooring Lines: It is the responsibilty of the Ship's Master to ensure that all mooring lines are kept tight. Berthing Master will constantly check a vessel's moorings and may at any time direct lines to be adjusted as circumstances warrant.

Tension Winches: When a vessel is fitted with tension winches, the latter must be set to manual operation and the brakes securely applied.

STORING: See "Prelims".

(i) Storing at Terminal discretion. Terminal launches normally employed.

(ii) Storing permitted during cargo transfer using stern lifting devices only.

(v) Usual Customs regulations.

(vi) Labour usually supplied by chandler.

CURRENCY: Bahamian Dollar is equal to U.S.Dollar. Notes and coins are interchangeable. U.S.Dollars are universally accepted.

SAFETY: *TERMINAL SAFETY REGULATIONS:* With the object of protecting all concerned against the possibility of fire hazards, oil and smoke pollution, vessels calling at South Riding Point Terminal must comply with the following safety regulations or other regulations which may be issued by the proper authorities from time to time.

Dangerous Area: The whole of the sea island and the onshore terminal are declared Dangerous Areas and the use of naked lights and smoking therein is strictly prohibited except in those places expressly designated by the Master of a vessel and the Terminal Manager.

A copy of the "Fire and Safety Regulations" (See "Appendix IIIA and IIIB") is given to the Master of every vessel by the Berthing Master on boarding and it is the responsibility of the Master to see that these regulations are strictly observed.

Inspection: The Berthing Master will conduct a safety inspection prior to the commencement of loading/unloading and at regular intervals thereafter to ensure that all safety regulations are being enforced.

A comprehensive list of safety requirements are detailed on a Ship/Shore Safety Check List (See "Appendix IVB") and must be signed by the Master of the vessel or his delegate and the Berthing Master (The "Check List" is as laid out in I.S.G.O.T.T.).

Galley Fires: Only approved steam or electric galleys in selected locations in the after part of the vessel, as agreed to by the Master and the Berthing Master, are permitted.

Boiler Tubes: Boiler tubes must not be blown whilst vessel is alongside and emitting smoke is strictly prohibited while vessels are in the vicinity of the terminal. Every precaution must be taken to prevent sparks and soot particles escaping from the funnel.

Firewires: Firewires of steel must be made fast and hang over the outboard bow and quarter whilst alongside to enable tugs to connect readily in an emergency situation. Firewires must be tended on board throughout cargo operations in order to maintain towing eyes at water level.

Deck Scuppers: Deck Scuppers must be securely plugged and cemented before loading/discharging operations commence. Approved mechanical means of closing scuppers may be acceptable.

Spillage Trays: See "Oil Pollution – Minor Leakages Onboard".

Main Engine(s): Immobilisation is prohibited whilst alongside a terminal berth. Minor engine repairs may be effected after receipt of written permission from the Berthing Master and providing the repair will not affect the prompt sailing of the vessel in an emergency or upon cargo completion.

Maintenance Work: No chipping, scaling, hot work or work of any kind that would cause a spark is allowed while alongside a berth.

Ventilation: When loading or discharging cargo or ballast, all open ullage pipes and sighting ports shall have installed approved flame arresters.

Stores: Inflammable or explosive ship's stores shall be kept in a safe place securely fastened.

Bilge and Dirty Ballast Water: Disposal of bilge and dirty ballast water over the side is strictly prohibited by the authorities and any pollution of the sea through these mediums will result in heavy claims and fines. The terminal will, in case of an oily discharge, take such steps as may be deemed necessary to fight the pollution before it spreads.

If the discharge is due to faulty equipment or material on the vessel or to negligence on the part of ship's personnel, the terminal shall be indemnified for any expenses incurred in connection with the preventative action taken. (See Oil Pollution – "Oil Spills").

International Code Flag 'B': International Code Flag 'B' shall be flown during the day and a red light exhibited by night by all vessels during cargo or ballast operations.

Transfer Cargo Operations: Transfer cargo operations shall not be started, or if started, shall be discontinued by the Berthing Master or Terminal Control if any of the following conditions prevail:

(a) During severe electrical storms.
(b) If fire breaks out at berth or on vessel.
(c) Should any condition develop which represents a hazard to the vessel or terminal facilities.

Fire-Fighting Equipment: Fire-fighting equipment of vessels alongside must be kept ready for use at all times.

Gas-Freeing: Gas-Freeing of vessels alongside sea island berths will not be permitted.

Earthing and Bonding: All metal on the shore side of an insulating flange should be electrically continuous to the sea island or inshore berths earthing systems and all metal to the seaward side should be electrically continuous to the vessel.

Insulating flanges are fitted on each loading arm.

Small Boats or Craft: Small boats or craft will not be permitted to moor alongside a vessel during cargo or ballast operations, unless special permission has been granted by the Berthing Master.

Permitted Entry: Only persons holding authorized passes will be permitted entry to the terminal or sea island. The terminal reserves the right to refuse admission.

Safety Responsibilities: Nothing in these regulations will relieve Masters of their responsibilities in observing the normal safety, fire prevention and security regulations. The Berthing Master is authorised to advise and request Masters to take additional measures to ensure a higher degree of safety if they find that circumstances warrant such action.

FIRE FIGHTING:

Responsibilities: The Fire and Safety Officer is responsible for all fire fighting operations at the sea island and the onshore terminal.

Fire Alarm: Do not hesitate to raise the alarm in the event of fire however small it may be.

The ship's fire alarm at the terminal will be one or more blasts of the ship's whistle or siren, each blast of not less than 10 secs. duration supplemented by a continuous ringing of the ship's bell and continuous sounding of the general alarm system.

The fire alarm at berths or elsewhere within the terminal or harbour area will be a continuous blast on the sirens sited on the onshore and offshore control buildings.

Action Ship – Fire On Your Ship:

1. Raise alarm.
2. Cease all cargo operations and then close all valves.
3. Fight fire and prevent it spreading.
4. Inform terminal of details.
5. Standby to disconnect loading arms.
6. Bring engines to standby.

Action Ship – Fire On Other Ship: You will be advised of necessary instructions to:

1. Cease all cargo operations and then close all valves.
2. Standby to disconnect loading arms.
3. Bring engines and crew to standby ready to unberth.

Action Shore: The operator in the control room will immediately contact the Fire and Safety Officer by phone or VHF radio. The Fire and Safety Officer will then direct operations.

1. Raise alarm.
2. Cease all cargo operations and then close all valves.
3. Fight fire and prevent fire spreading.
4. Standby to disconnect loading arms.
5. Inform all ships of details.
6. Terminal emergency procedure is immediately effective.

Emergency Situation: During an emergency situation on board a vessel alongside, the Berthing Master will be in charge of organising the preliminary fire-fighting/anti-pollution procedures assisted by the operators in the Control Room and at the berths until the Fire and Safety Officer at the terminal takes over the direction of all fire fighting operations.

The Berthing Master is to make use of all available means at his disposal, such as tugs, launches, terminal equipment and other facilities to assist the vessel and protect lives and terminal facilities.

APPENDICES:

Appendix IVA:

The Master
SS/MV ....
Port: ....
Dear Sir,

SOUTH RIDING POINT TRANSSHIPMENT TERMINAL
SAFETY REQUIREMENTS

Responsibility for the safe conduct of operations whilst your ship is at this Terminal rests jointly with you, as Master of the ship, and with the responsible Terminal representative. We wish, therefore, before operations start, to seek your full co-operation and understanding on the safety requirements set out in the Ship/Shore Safety Check List, which are based on safe practices widely accepted by the oil and tanker industries.

We expect you and all under your command to adhere strictly to these requirements throughout your stay alongside this Terminal and, for our part, we will ensure that our personnel do likewise and co-operate fully with you in the mutual interest of safe and efficient operations.

Before the start of operations, and from time to time thereafter, for our mutual safety, a member of the Terminal staff, where appropriate together with a responsible officer, will make a routine inspection of your ship to ensure that the questions on the Ship/Shore Safety Check List can be answered in the affirmative. Where corrective action is needed, we will not agree to operations commencing or, should they have been started, will require them to be stopped.

Similarly, if you consider safety is endangered by any action on the part of our staff or by any equipment under our control, you should demand immediate cessation of operations.

There can be no compromise with safety.

Please acknowledge receipt of this letter by countersigning and returning the attached copy.

Appendix IVB: (South Riding Point)

Ship/Shore Safety Check List

Ship's Name ....

Berth .... Port ....

Date of Arrival .... Time of Arrival ....

Instructions for Completion:

The safety of operations requires that all questions should be answered affirmatively. ☑ If an affirmative answer is not possible, the reason should be given and agreement reached upon appropriate precautions to be taken between the Ship and the Terminal. Where any question is not considered to be applicable, a note to that effect should be inserted in the remarks column.

☐ – The presence of this symbol in the columns 'Ship' and 'Terminal' indicates that checks shall be carried out by the party concerned.

The presence of the letters A and P in the column 'Code' indicates the following:
A – The mentioned procedures and agreements shall be in writing and signed by both parties.
P – In the case of a negative answer, the operation shall not be carried out without the permission of the Port Authority.

	Ship	Terminal	Code	Remarks
1. Is the Ship securely moored ?	☐	☐		
2. Are emergency towing wires correctly positioned ?	☐	☐		
3. Is there safe access between Ship and Shore ?	☐	☐		
4. Is the Ship ready to move under its own power ?	☐	☐	P	
5. Is there an effective deck watch in attendance on board and adequate supervision on the Terminal and on the Ship ?	☐	☐		
6. Is the agreed ship/shore communications system operative ?	☐	☐	A	
7. Have the procedures for cargo, bunker and ballast handling been agreed ?	☐	☐	A	
8. Has the emergency shut-down procedure been agreed ?	☐	☐	A	
9. Are fire hoses and fire-fighting equipment on board and ashore positioned and ready for immediate use ?	☐	☐		
10. Are cargo and bunker hoses/arms in good condition and properly rigged and, where appropriate, certificates checked ?	☐	☐		
11. Are scuppers effectively plugged and drip trays in position, both onboard and ashore ?	☐	☐		
12. Are unused cargo and bunker connections, including the stern discharge line, if fitted, blanked ?	☐	☐		
13. Are sea and overboard discharge valves, when not in use, closed and lashed ?	☐	☐		
14. Are all cargo and bunker tank lids closed ?	☐	☐		
15. Is the agreed tank venting system being used ?	☐	☐	A	
16. Are hand torches of an approved type ?	☐	☐		
17. Are portable VHF/UHF transceivers of an approved type ?	☐	☐		
18. Are the ship's main radio transmitting aerials earthed and radars switched off ?	☐	☐		
19. Are electric cables to portable electrical equipment disconnected from power ?	☐	☐		
20. Are all external doors and ports in the amidships accommodation closed ?	☐	☐		
21. Are all external doors and ports in the after accommodation leading onto or over-looking the tank deck closed ?	☐	☐		
22. Are air conditioning intakes, which may permit the entry of cargo vapours, closed ?	☐	☐		
23. Are window-type air conditioning units disconnected ?	☐	☐		
24. Are smoking requirements being observed ?	☐	☐		
25. Are the requirements for the use of galley and other cooking appliances being observed ?	☐	☐		
26. Are naked light requirements being observed ?	☐	☐		
27. Is there provision for an emergency escape possibility ?	☐	☐		
28. Are sufficient personnel on board and ashore to deal with an emergency ?	☐	☐		
29. Are adequate insulating means in place in the ship/shore connection ?	☐	☐		
30. Have measures been taken to ensure sufficient pump room ventilation ?	☐	☐		

	Ship	Shore
Are tank cleaning operations planned during the ship's stay alongside the shore installation?	Yes/No *	
If so, have the Port Authority and Terminal been informed?	Yes/No	Yes/No *

* Delete Yes or No as appropriate.

Declaration:

We have decided, where appropriate jointly, the items on this Check List, and have satisfied ourselves that the entries we have made are correct to the best of our knowledge, and arrangements have been made to carry out repetitive checks as necessary.

NATAL: (Also see Page 238)

SHIPMASTER'S REPORT: August 1994.
The Master received the following telex from Agent:
Quote:
Sanitary Health Inspection Natal:

We have just received information from Master on one of our vessels, that the Health Inspectors at Natal confiscated all provisions which were kept in deep-freezer or cool-store, according to following criterias:

All items with the expiry date overdue.
All items with the date "Best before" overdue.
All items without any expiry stamp.
All meat which is older than one month at the time of delivery, according to the stamp.
All buckled tins.

The Master succeeded in preventing the Authorities from taking the items ashore and burned everything in the vessel's incinerator. According to the local Agents, who tried their best to assist, everything was correct according to Brazilian Law.

Please be guided accordingly in order for you to take your own precautions before arrival.
Unquote.
Master's comment:

The Health Inspector, who had recently been sent up from Rio de Janeiro, did not board us as he was off-duty at that time. However, he is known to be strict, and it is well to be prepared.

PORTO TROMBETAS: (Also see Page 248)

SHIPMASTER'S REPORT: April 1994 (Received September 1994).
Report on Amazon River Navigation:

Vessel coming from Tenerife and bound for Porto Trombetas, which is situated about 590 miles up-river from Amazon Entrance Buoy.
Approaches to Amazon Entrance Buoy: Amazon Entrance Buoy fitted with Racon 'G' was picked-up on radar at 18 miles and ship's course was adjusted. Continuous bottom soundings check was maintained. It was noticed that water colour starts changing about 60 miles before Amazon Entrance Buoy. At about 30 miles before Amazon Buoy, water colour is totally muddy. Soundings of 8.0 m. – 10.0 m. below keel were observed. Shallow water area starts about 10 miles East of Amazon Entrance Buoy and further 20 miles until Amazon Buoy No. 1, thus total mileage of 30 miles over Amazon Bar.

It is most important that the buoys positions be checked well beforehand by local Agent, who obtains same from Brazilian Navy. Agents at Santana provided us with all latest positions of buoys. On plotting these positions on B.A. Chart No. 2189, it was found that the buoyed channel has shifted drastically and new channel buoys, especially Buoy No. 9 to Buoy No. 12, were going over sand bank. We requested Agent to re-check buoy position with Navy/Coast guards and advise correct positions of buoys. Agent came back with same positions. From sailing directions, it was clear that sand banks keep changing. B.A. Charts are not corrected by Admiralty itself, hence navigation on B.A. Charts should be done with great caution.

Position of buoys as received from Agents were plotted on chart and navigation was done with maximum caution. Vessel's bottom sounding were constantly checked. All the buoys were picked-up on radar at distance of 7-8 miles. Vessel's position plotted frequently and verified with soundings. Vessel experienced strong current. We were advised by the Agents that as per Brazilian Hydrographer/Navy, Amazon Bar has draft of 32 ft. (FW) at low water and 37 ft. (FW) at high water.

Vessel constantly got soundings of 4.0 m. – 5.0 m. below keel.

Channel Buoys were picked-up on radar at 6 miles.

In channel itself, which is wide, we observed soundings of 8.0 m. – 10.0 m. below keel. There are a total of 6 pairs of buoys in channel. During our transit only 1 buoy was not lit, otherwise channel is very clear.

After clearing the channel, depth of water increases and navigation becomes much easier. While inbound, total navigation until Fazendinha Anchorage was done on B.A. Chart No. 2189. One point to note here is that there is no mention of Fazendinha anywhere on chart. However, position of same obtained from Agents. The name of anchorage area given as there is a church named Fazendinha on North shore. After leaving buoyed channel, vessel steered course to keep in the middle of deep water. Ponta do Cue Racon was picked-up on radar at 16 miles. All lights were working.

When Southbound passing through Canal do Norte (Lat. 00° 35′ N., Long. 50° 25′ W.), vessel should keep close to Ilha Caviana de Dentro, and Banco Carolina Buoy (Fl.R.3) should be kept on starboard side. Then steer clear South of Ilhas Pedreira Island Lt., and from there steer South of Pta. do Pau Cavade Lt. with Racon 'X' and from this point steer in deep water up to Macapa. At this point, vessel starts meeting ships outbound. From Macapa to Fazendinha, steer in deep water, keeping Bancoda Cascalheria Lt. on your starboard side and Fl.G.5 sec. light on port side and steer to Fazendinha Anchorage. The safe position to anchor is by keeping Santana Leste Lt. bearing 270° × 1.3 miles. On B.A. Chart No. 2189, South side of Fazendinha Anchorage is not shown. However, as per Brazilian charts, there is enough water on South side.

Vessel anchored at Fazendinha at 0630 hrs. when it was already daylight. However, great care must be taken if anchoring during night hours, because Agent and Port officials do not board at night-time, and every ship has reported heavy thefts at anchorage and at Santana. Agent and Authorities boarded at 0830 hrs. It takes about 45 minutes to clear formalities as Quarantine undertake a thorough check of ship. Agent from Santana brought Brazilian charts and Tide Tables. However, two charts for Amazon River were not available.

Two Pilots boarded at Fazendinha. They were well experienced with river and spoke sufficient English, which is safe for navigation. Vessel picked-up anchor at 0900 hrs. and started heading towards Porto Trombetas. Amazon River itself is deep enough for safe navigation. Vessel was steaming at maximum possible safe RPM.

Amazon River is not marked. However, Pilots are very experienced and know the river well. Vessel must have good radar, as night navigation is totally done by radar only.

Porto Trombetas is situated in River Trombetas, and from entrance of river until Porto Trombetas, the river is well marked with buoys, and night navigation in clear weather is no problem. It took nearly 42 hours from Fazendinha to Porto Trombetas and vessel went straight alongside.

Pilots stay onboard as they bring the vessel back to Santana. Santana is nearest port to Fazendinha Anchorage.

Loading at Porto Trombetas is by one loader only and loading rate of 3,000 tonnes/hr. was given. Terminal operators are co-operative. To land ashore, ship has to use boat service as landing on Terminal is not allowed.

Departure from Porto Trombetas was at 1000 hrs., and vessel arrived at Fazendinha Pilot Station at 1400 hrs. next day. It took 28 hrs. downbound.

After dropping the Pilots, vessel's speed was adjusted so as to arrive 10 miles West of buoyed channel, 1 hour before low water at Ponta do Ceu. In Tide Tables, HW and LW timings are given for Ponta do Ceu. For Barra Norte, you have to calculate the tide for position 'H' (Lat. 01° 30′ N., Long. 49° 10′ W.), which has an amplitude of 78% and about 3 hours 20 minutes earlier for HW and 4 hours 30 minutes earlier for LW than the tide timings for Ponta do Ceu.

The tidal current at Barra Norte has a general direction of S.W. (flood tide) and N.W. (ebb tide) and runs at 3 knots (Neap) and 5.5 knots (Spring).

Vessel's speed was adjusted and vessel entered buoyed channel. Sometimes you might see vessels at anchor, as some vessels go at full speed and anchor off Ponta do Ceu and wait for tide. Some vessels clear buoyed channel and anchor North of channel and wait for high water at Point 'H'.

Vessel's position and soundings were constantly checked. After passing Amazon Buoy No. 1, vessel's speed was reduced to avoid heavy squatting. However, speed should be so maintained that the Bar is cleared in time. All over the Bar, soundings of 2.0 m. – 3.0 m. below keel were noted. After clearing Amazon Racon Buoy, vessel steered course so as to go through deep water. Soundings started increasing slowly. When soundings of 15.0 m. below keel were obtained, ship's speed was increased to sea speed, and before RPM could come to maximum, the soundings were more than 30.0 m. below keel.

RIO GRANDE: (Also see Page 256) **(See Late Plans)**

SHIPMASTER'S REPORT: August 1994.
Berth: Cotrijui Terminal.
Cargo: Soya Bean Oil.
Connection: Hoses.
General: An unsafe berth. 3 ships in the previous month parted all moorings and were swept into the river. Very few dolphins on the jetty restrict mooring options. Ships slightly larger than ours have to have a tug pushing the vessel alongside at all times.

The berth has 3 fenders. But the central fender is larger than the others, so the vessel only rests on 2 fenders (See "Plans").

There is a partial groyne beneath walkway and grain elevator. In times of heavy inland rain and strong current, the current is deflected by the groyne to laterally push the vessel off the berth. If mooring ropes are not tight at all times, this can cause the vessel to oscillate and pivot around the central fender, and many ships have parted mooring ropes at this berth. Insufficient bollards on the jetty give poor loads.

Poor access ladder.

Berth: Incobrasa.
Cargo: Degummed Soya Bean Oil.
Connection: Hoses.
General: Max. draft 37 ft. (F.W.).
There is a strong river current at all times.
3 tugs used for mooring and unmooring.

SANTOS: (Also see Page 265)

SHIPMASTER'S REPORT: August 1994.
The Master received the following telexes from Agent prior to arrival:

"*Santos Anchorage – Pirates:* We have consulted Bimco and our Sao Paolo Office, who both confirm your information concerning Santos Anchorage being high risk area for piracy.

Thus Bimco suggest to keep at least 20 nautical miles off the coast as a safety margin, meaning that drifting will be required in order to delay your arrival time outside Santos. However, please keep Agents informed of arrival, also concerning drifting outside Santos, as congestion is expected – and first in first served."

"Have confirmed with Pilots possibility for a vessel to anchor 15/20 miles away from Santos Roads, and they have replied no problem since vessel can communicate via VHF with pilot station and Santos Radio (in case of any telephone call from Santos). As such go ahead anchoring at the position that you most prefer. Furthermore bear in mind (1) on your arrival/dropping anchor to report to Pilots over VHF Channel 16 the exact arrival time at Santos. (2) When vessel is supposed to dock, Pilots may get in touch with vessel only 1.0 – 1.5 hours before boarding time.

Fresh Water:

"Regarding fresh water, can say that we have one of the most expensive water in the world which costs U.S.$ 10.65/tonne (by barge) and U.S.$ 20.70/tonne at the quay. Kindly confirm your acceptance for such prices, as well as the quantity intended to be supplied."

"*Reporting/Documents:*

Please inform last port of call and arrival drafts. On arrival at Santos Roads please contact pilot station on VHF Channel 16 and inform exact arrival time, also contact "PWS 88 N Concomtran" – see your "Guide to Port Entry".

Upon berthing, local Authorities will require following documents:

10 copies Crew List.
10 copies Passenger List (if any).
2 copies Vaccination List.
1 copy Maritime Declaration of Health.
1 copy Ports of Call List.
3 copies Spare Parts List, no special form required for engine/deck/radio department – Inventory books are not allowed for presentation – Minimum 100 items inserted.
3 copies Personal Effects List with marks/Serial No./Model No. and exact quantity of objects.
3 copies Bonded Stores List.
3 copies Narcotics List.
3 copies Ammunitions List.
3 copies Animals List.

Spares and personal effects undeclared are confiscated by Customs. Please send us message addressed to Santos Port Health, requiring Free Pratique 72 hours before arrival at Santos. For your guidance, Port is not equipped with fenders alongside. A private company has them to hire for U.S.$10.00 per day/fender. In case needed, kindly ask same to Agent or to your Boarding Pilot in order to arrange accordingly. Please advise if any requirement needed upon berth.

Master's Comments on above:

Concerning Piracy: We did in fact anchor 19 miles from the pilot station and had no problems with communication with the pilot station or with unwanted visitors.

Fresh Water: We had to pay that price. The price has come into being since the Government changed the Brazilian currency.

Declaration of Spares/Stores at Santos: They are strict and have been known to remove liners, cylinder heads, etc., that have not been declared after a rummage gang visited the ship on her third call to Santos (P&I Rep and local solicitors were able to retrieve the goods, but at what cost I do not know).

In Cabedelo and Natal, the Customs were not bothered, even though I presented the same Customs papers on arrival at both ports.

Fenders: The fenders, we were given, were car tyres inserted on a solid wooden pole, which were hung-off a bollard by a wire.

Brazilian Ship Reporting System: In the ALRS Vol. 1, the system is quoted as being voluntary. However, fines have been levied on vessels not complying, so really it is mandatory to comply. I sent our telex to: Comcontram, Rio – Telex: 2153180+.

TRAMANDAI: (Also see Page 281)

SHIPMASTER'S REPORT: July 1994.
Berth: Petrobras/DT Sul – SBM.
Cargo: Discharging naphtha.
Connection: Hoses.
General: SBM very open to weather, and vessel may be delayed in berthing or may have to vacate berth (2 SBM's operational).

Chile

HUASCO: (Also see Page 390)

PORT LIMITS: Inside a line from mouth of Huasco River and "Blanco Small Barren Islands".

PILOTAGE: Vessels over 220 m. LOA require 2 Pilots. Pilot ladder to be rigged on port side.

ANCHORAGE: Anchorage for vessels over 100 m. LOA.

(1) Lat. 28° 27′ 06″ S., Long. 71° 14′ 04″ W.
(2) Lat. 28° 26′ 53″ S., Long. 71° 14′ 10″ W.
(3) Lat. 28° 27′ 05″ S., Long. 71° 14′ 52″ W.
(4) Lat. 28° 27′ 17″ S., Long. 71° 14′ 46″ W.

TUGS: 2×3,000 h.p. tugs available. Use of one tug is compulsory.

AIRPORT: Nearest commercial airport is at Serena, 241 km.

AUTHORITY: *Contact:* Ricardo Bendal Vidal, Harbour Master.

PUERTO CORRAL: (Also see Page 395)

TUGS: *Delete and substitute:* Compania Portuaria Corral has one tug of 1,200 h.p. and 17 tons bollard pull. Compania Portuaria Talcahuano has one tug of 550 h.p. On request, tugs from other locations can be made available.

Vessels up to 180 m. LOA should use one tug of minimum 1,200 h.p. to go alongside. Vessels between 180 m. and 229 m. should use one tug of minimum 2,000 h.p., or 2 tugs with a combined minimum capacity of 2,000 h.p.

The use of tugs is not compulsory when leaving, if weather conditions are favourable.

TOCOPILLA: (Also see Page 403)

SHIPMASTER'S REPORT: August 1994.
Vessel:
Type: Bulk carrier.
Summer d.w.t.: 27,476 tonnes.
Summer draft: 31 ft. 6 in.
Length of stay: 4 days.

Position Reporting System: To avoid heavy fines, when entering and within Chilean territorial waters, reporting system must be followed (See"General" before first port).

Documents: Last Port Clearance and normal inward papers.

Clearing: Undertaken upon arrival after anchoring.

Pilotage: Pilots board at anchorage area from 0700 hrs. to 2000 hrs. for berthing. Unberthing any time.

Anchorage: Good anchorage 7-10 cables from shore. Depths 30 m. – 70 m. Anchorage became unsafe when vessel rolled in bad weather (strong winds, heavy swell). When winds blowing from shore, brown dust is produced from the nearby mountains, and vessel covered, but dust washed away easily.

Draft: Max. permissible draft 37 ft. Max. air draft 10.5 m. – 11.0 m.

Tugs: Two powerful tugs assist with mooring/unmooring. In case of bad weather (emergency), while alongside, tugs can be contacted by VHF Channel 16.

Berthing: Vessel moored port side to. Firstly starboard anchor is dropped and kept slack (finally slacked to 8 shackles). Then 2 ropes secured to each buoy (No. 1 forward, No. 3 and No. 4 aft, No. 2 forward). Then 2 spring lines secured to shore hooks. Shore gang do not board for spring lines. All lines are transferred to buoys and shore by boat. Distance from shore 50 m. – 60 m.

At a distance of about 25 m. from the vessel's port side, there are a few hidden rocks which are uncovered at low tide.

Special attention must be given all the time to vessel's lines, especially those at Buoy No. 3.

Mooring Lines: At least 10 new or very good mooring lines of 220 m. length each are required, otherwise local lines can be rented at U.S.$300.00 per line per day.

Holds: Should be extremely clean with special care to higher and hidden parts of holds. Local surveyors are very strict, and many vessels are rejected.

Cargo: Loaded part cargo of bulk and bagged nitrates (19,846 tonnes).

Bulk cargo loaded with mechanical belt loader, and vessel shifted by Pilot and her own means as per rotation plan.

Steel bars and machines for trimming (7-8 tonnes) taken on board by stevedores and ship's cranes.

Loading rate 300 – 600 tonnes/hr. Bagged cargo of normal bags 50 kg. and maxi-bags of 1,000 kg. in slings of about 12 tonnes loaded over bulk with plastic separation between cargoes.

Watchmen: Compulsory. Good 24 hours service provided.

Fresh Water: Not available.

Fuel Oil: Not available.

Fresh Provisions: Available from local market, but expensive.

Shore Leave: Allowed from anchorage and mooring buoys. Boat service through Agent, costs U.S.$70.00 per round trip.

People's Republic of China

HUIZHOU: (Also see Page 424) **(See Late Plans)**

SHIPMASTER'S REPORT: August 1994.

Location: N.W. of Taya Bay and North of Ya-Ling Wan (Dumbell Bay) in position Lat. 22° 41.8′ N., Long. 114° 33.5′ E.

Port: Newly opened in October 1992. Port area under reclamation in May 1994.

Pilotage: Compulsory. Undertaken from sunrise to sunset. 3 Pilots and an Assistant Pilot work with 1×1,900 h.p. tug. Also used as pilot boat.

Approaches: Pilot boarding position: Lat. 22° 36.24′ N., Long. 114° 36.35′ E.

After passing Fisherman Rk. Beacon 1.3 cables off on starboard side with course 325°, Fairway Entrance Buoys No. 1 (G) and No. 2 (R) are seen. Channel course is 320°(T) until wharf. Channel width 80 m. Depth is 8.5 m. in L.W.

		Lat.	Long.
Fairway buoy locations	No. 1 (G)	22° 39.90′ N.	114° 35.38′ E.
(approx.)	No. 2 (R)	22° 39.84′ N.	114° 35.32′ E.
	No. 3 (G)	22° 40.70′ N.	114° 34.62′ E.
	No. 4 (R)	22° 40.69′ N.,	114° 34.57′ E.
Port Basin starboard buoy (G)	No mark	22° 45.52′ N.,	114° 33.92′ E.
Port Basin port buoy (R)	No mark	22° 41.61′ N.,	114° 33.52′ E.

Port Restrictions: LOA less than 150 m. and max. draft 8.5 m.
Tugs: Only one small tug available.
Berth: Total length of wharf is about 350 m., not including East side dolphin jetty.
Cranes: 2×10 ton shore cranes available.
Port Entry: Vessel must advise ETA at Huizhou Port 24 hours prior to the ship's arrival. Huizhou Harbour Master on VHF Channel 16, but signal is very weak and English poor.

NANTONG: (Also see Page 430)

SHIPMASTER'S REPORT: October 1994.
Pilotage: The Pilot cannot be arranged by the Agent to take vessel from Nantong to Liuhe Anchorage if loading is completed after 1500 hrs. local time. Sometimes vessel can be shifted from the berth to Langshan Anchorage.
General: Sailing through shallow waters of the Yangtze River has a harmful effect on the condition of the sea chest and stern tube. The level of water contamination is very high in the Yangtze River.

SHUIDONG: 21.28 N. 111.07 E.

SHIPMASTER'S REPORT: November 1994.

Vessel:
G.T.: 7,150 tons.
N.T.: 4,051 tons.
Summer d.w.t.: 12,784 tons.
LOA: 123.3 m.
Beam: 20.0 m.
Draft: 8.79 m.

Shuidong is a new port still under major construction and facilities are limited.

Vessel loaded 1,900 tonnes Linear Alkyl Benzene in Japan for discharge at this port. No information is available in any publications on board. Agents in Hong Kong were asked to obtain as much information as possible from Agents in Shuidong. Despite their efforts, no reliable guidance could be obtained.

The only chart covering the area is B.A. Chart No. 3892 and Sailing Directions NP 30 (4th Edition, Chapter 10, Parts 10.48 to 10.55). The port is not shown or mentioned. I was advised that this is a new port and no information has been published yet.

Port is located on the left bank of river, in position Lat. 21° 28.30′ N., Long. 111° 07.30′ E. The pilot station is located in position Lat. 21° 23.07′ N., Long. 111° 07.46′ E. The port is approached via a buoyed channel, with leading marks on shore.

Approach to the port is not difficult. A storage tanker (250,000 tonnes) is moored in approx. position Lat. 21° 21′ N., Long. 111° 25′ E. It is not operational, but is expected to start in the near future. It has a Racon type mark, but no distinct letters to identify it. Agent could not give me name of vessel.

The island of Dafangij Dao, shows well on radar at 12 miles and gives good guidance to pilot station and buoyed channel. The only difficulty is the large concentration of fishing vessels. It is a case of picking your way through them. They are nearly always stopped and respond to whistle signals.

Vessel anchored 0.5 miles South of Buoys No. 1 and No. 2. These are in position Lat. 21° 23.4′ N., Long. 111° 07.4′ E. and Lat. 21° 23.5′ N., Long. 111° 08.1′ E. respectively. Our draft was forward 4.7 m. and aft 5.65 m. Echo sounder showed 7.0 m. of water under-keel at this point.

No communication directly with Pilots or port. Contact is made via Shuidong Radio on Channel 16, shifting to Channel 83. All information is passed to vessel via this station. Agent will be on VHF Channel 68 in near future.

Pilot boat came out to vessel at anchorage and guided the vessel to berth. Three Pilots boarded, only one of which spoke limited English. The leading marks give a course up the first part of the channel of 349°, this is followed up to Buoys No. 7 and No. 8. The depth under the keel was never less than 4.0 m., this at Buoys No. 5 and No. 6, most of the time 6.0 m. was normal. At Buoy No. 8, course is altered to 335°. At Buoy No. 10, course altered to 316°. This takes vessel to Buoy No. 14, where the wharves for the port start.

Major construction works are taking place, especially further up the river, where conventional wharves and terminals are being built. First jetties in the river are the tanker berths. Both brand new with modern facilities. Good fenders. No tugs used for berthing. Vessel berthed on the ebb tide, port side too Berth No. 2. Starboard anchor is used as a brake. It is important to get a head line and aft back spring out as soon as possible. Current is strong on the berth and frequent use of engine must be used to hold vessel against current. Final moorings were 3 head and 3 stern lines and 2 springs either end. Starboard anchor finally ending up with 4 shackles in water. Depth of water alongside at low water 2.0 m.

Accommodation ladder was used on the jetty in our particular position, but if Chicksan arms are to be used, then portable gangway would have to be used.

As normal in Chinese ports, many officials board. All documents and certificates are checked closely. No difficulties with any officials. Quarantine do not allow any ballast water to be discharged into river, unless it is disinfected first. They also checked all stores and toilets/bathrooms, if any signs of cockroaches, they disinfect and spray these areas. As some Cholera Certificates had expired, all persons requiring injections were done.

Terminal is new and tank farm is close. It would appear that more building will take place close to jetty. Plans are to open up the port even more, mainly coastal traffic at present. We discharged using a 6 in. flexible hose. No difficulties with rate or pressure. Total discharge time was 18 hours.

Agent was asked to supply a chart of the port area, but none is available at this time. None have been published. They intend to issue one soon. As it is also difficult to communicate with any officials or surveyors, information was hard to come by.

Shuidong town is about 14 km., and can be reached by local motorcycle taxi. There are some small roadside restaurants outside the gate and a hotel. Food is cheap and reasonable.

Vessel leaves berth near the end of slack water/beginning of ebb tide. This is straight forward. Weight is taken on anchor and all lines let go aft. Single up to a forward spring. Effect of current pushes stern off jetty. Anchor is heaved and with use of engine and rudder, vessel is moved of jetty. When well clear, forward spring is let go and anchor heaved home. It is best to leave anchor ready as it may be required to turn vessel round in river. After turning, vessel proceeds outwards. Pilot leaves vessel in vicinity of Buoys No. 5 and No. 6. The only problem outwards can be the fishing craft in the channel.

YANTIAN: (Also see Page 448)

SHIPMASTER'S REPORT: September 1994.
Ship-To-Ship Transfer from "Spec-Lde-888" (262,000 d.w.t.):

Communications prior to arrival were by Sat 'A' Fax (no difficulties) and by VHF when in range.

The official daylight hours of 0600 hrs. – 1800 hrs. for berthing are strictly observed.

We anchored 1.8 miles West of Xiaosanmen Dao, in an anchorage designated by the "888" after the "hair-raising" experience of crossing the main traffic route East of Hong Kong. The anchorage and the position of the "888" move according to the Master's interpretation of the weather. The anchorage provided good holding ground in about 22.0 m. of water.

There was a constant movement of small off-takers to the "888's" starboard side, but the import tankers were subjected to a much more casual arrangement. Two tugs are required to assist in berthing and unberthing import tankers to "888's" port side. These tugs are governed by the Yantian Port Authority, and the Master of the "888" appears to have no say in their movements. We were the second in line on arrival, but waited for 30 hours, during which time the berth was vacant, for a second tug to arrive from Yantian.

While the vessel was at anchor, the Agent and Immigration Authorities boarded to carry out a full port arrival inspection, during which all documentation was thoroughly scrutinised, and bond sealed, Sanitary Inspection made, etc. 8 Crew Lists were required. The Immigration officials made a return visit prior to our departure to check the bond.

Information from the "888" with regard to berthing prospects was very scant and hard to come by and appears to be affected by tug availability. The local Chinese Berthing Pilot complained to me about the tugs, which appear to be of limited use. The Pilot's style of berthing was to lay us parallel to the berth about 4 cables off and have the tugs push us alongside, which operation required our intervention at the last minute to prevent our starboard bow landing heavily between the "888's" two forward fenders. The departure procedure was the reverse, tugs pulling and Pilot away as soon as possible with our stern falling rapidly down onto the "888's' port bow, this after some 8 hours of waiting for the tugs.

Cargo operations were handled smoothly by the "888", the British Officers in particular being very competent and co-operative. Cargo surveyors based on the "888" took before and after measurements with our equipment, but seemed to be competent.

Safety appears not to hold a high profile, with few safety hats and shoes on view. The access between the "888" and this vessel was by a combination of both vessels' accommodation ladders being pulled together, and is an accident waiting to happen. A safer arrangement is urgently required.

YINGKOU: (Also see Page 448)

SHIPMASTER'S REPORT: October 1994.

Berth: Bayuquan.

Documents: Prepare the following prior to arrival:

1 copy Maritime Declaration of Health.
10 copies Crew List.
2 copies Personal Effects List.
2 copies Bonded Stores List.
2 copies Dangerous Cargo List.
2 copies Currency List.
2 copies Ports of Call List.

Agent gives Report of Entry Form to be filled-in.

Departure:

All Crew Shore Passes will be collected for Immigration checking.

Pilotage: Compulsory for all vessels.

VHF: Prior to approaching pilot station, vessel must call Bayuquan Port Control through Channel 16. At Xingang, call Xingang Port Control on Channel 74 and report vessel's name, max. draft, last port of call, your intention to load or discharge, and name of your Agent.

Tugs: Tugs and mooring assistance available, 2 tugs used.

Stevedores: To be arranged by Agent.

Fresh Water: Available.

Fuel: Fuel oil available.

Customs Allowance: 200 cigarettes and 1 bottle of spirits.

Repatriation: Possible.

Time: GMT plus 8 hours.

Shore Leave: Every crew member going ashore must carry a Shore Pass and Seaman's Book.

ZHUHAI: 22.18 N. 123.35 E.

SHIPMASTER'S REPORT: April 1994.

Discharge of two parcels of gas oil:

This operation was the second discharge port in China. At the initial port (Beihai), 5,400 tonnes of gas oil was discharged into barges. Due to poor weather, no officials visited the vessel prior to departure, but all paperwork was forwarded by State Agents "Penavico" to Zhuhai.

Communications by telex and fax prior to arrival gave an indication that operations would be relatively well organised.

The vessel updated ETA's as per normal and arrived at night.

Anchoring position being in the Southern end of the waiting and unloading area (approx. 22° 04′ N., 113° 44′ E.). As the maximum arrival draft was 11.2 m., great care was taken with tidal information. Minimum under-keel clearance was noted at 2.0 m. during stay.

The area is very busy with naval traffic and numerous fishing craft, although the anchorage area is not particularly well used.

After arrival, very little information was obtainable from "Penavico", and the services of the Agent in Hong Kong were invaluable. All messages were copied to them and numerous telephone calls were the norm to try and gain information regarding the discharge.

It was 3 days before there was any discharge operation, and this was a combined 2 Bill of Lading parcel into small tankers. We discharged to tankers on either side, after the usual meeting about using fenders/proper hoses, etc., as is the standard for Chinese ports.

This parcel was completed after 2 days (approx. 11,000 tonnes discharged into 13 vessels). The remaining parcel of 4,000 tonnes proved more difficult. As it had been sold on from the original consignee to a company not in the region of Zhuhai, there appeared to be difficulties ashore with numerous points.

We were informed that it would be lifted in one tanker of 4,800 d.w.t. size. "Penavico" were informed that the proper fendering and hoses would be required by a vessel of this size, as up until then the largest barge had been 1,700 tonnes.

As there was so much confusion ashore, Mabanaft sent a representative from Singapore to help out with matters in Zhuhai. It was 8 days before discharge was commenced into tanker "Daqing 212", a rather large looking 4,800 d.w.t. vessel. She was equipped with 2 × 3.0 m. × 1.5 m. diameter pneumatic fenders. We had rigged all available twin tyre fenders (9 units). 3 lengths of 6 in. hose were used for the transfer. This was assembled on board our vessel and returned to the "Daqing 212" at the end of discharge. Discharge was completed the same evening and the "Daqing 212" sailed.

We awaited final Clearance before sailing for Hong Kong to discharge the final parcel of 10,184 tons of diesel.

Nobody was available on the next day, but we were assured that by the following afternoon all would be fixed, and Clearance given. The Agent and officials boarded at 1645 hrs. This was the first visit by any proper shore representative of Penavico/Customs/etc., since the vessel had arrived some 15 days earlier.

Customs officials were not happy with papers received from Beihai and refused to clear ship outward. They said things had to be confirmed with Beihai area, and that it would be cleared by the next day. The Penavico Agent was of no assistance in the matter, and it appeared that there was no intention of giving us Clearance in the first place.

They left the vessel at 1730 hrs. Owner and Hong Kong Agent were both informed of the situation.

We were later informed by Hong Kong Agent that Clearance would be granted next day.

The next day we were informed by Hong Kong that the Agent and Customs were on their way to the vessel, to give Clearance. Later, I was asked by Penavico to clarify the cargo carried from Beihai, as there appeared to be a discrepancy in the Beihai Customs papers. Having done this, I was asked to check the Entry Report form, but as I had already informed them, I did not have any Customs papers from Beihai at all. This was stated on telex, and Zhuhai Customs were given copies of all Bills of Lading relating to the cargo.

At 1700 hrs., Hong Kong informed the vessel that Customs would not now be attending the vessel, and we would have to wait another 2 days. We received message from Penavico stating that Customs wished me to make out new Entry Report form with the figure 25,114 tonnes as through-cargo from Beihai, after which all would be in order, and Clearance Inspection undertaken. I was told that the original figure was incorrect.

We were asked to supply a statement absolving Zhuhai Customs from any financial responsibility. I was told by Hong Kong Agent that this was in case if later there followed a claim for the difference in the through-cargo figures. If I did not supply this statement, the delay would perhaps run to several more days.

At 1600 hrs., the Agent in Hong Kong called and informed me that the Customs were on their way to the vessel. Officials boarded at 1715 hrs., 10 persons in total, the Report of Entry from Beihai was presented. There was an error in the onward cargo column. I changed the figure from 26,113 tonnes to 25,113 tonnes and initialled it. That was Clearance completed.

I fail to understand why this could not have been done in the first place, but as already stated, there was more behind this than just a simple error in figures.

At 1750 hrs. Clearance was given.

At 1800 hrs. commenced heaving anchor to leave area, after 18 days in port.

Agents in Hong Kong must be thanked for their assistance throughout the period, as they were our main line of communication. The representative of Mabanaft Singapore worked very hard on arrival at Zhuhai to smooth the operation along.

Croatia

PLOCE: (Also see Page 486)

AGENT'S REPORT: October 1994.

The following is Agent's reply to questions from a vessel operator.

Terminal: Terminal Tekucih Tereta.

(1) Berth Operator/User: "Energopetrol Ploce" D.O.O., Ploce Neretvanskih Gusara BB.
(2) LOA: Unlimited.
(3) Max. Beam: 27.0 m.
(4) Max. d.w.t.: As much as possible within given parameters.
(5) Max. Draft: 10.50 m.
(6) Port Authority do no specify under-keel Clearance: Bottom is mud.
(7) Min. Depth in Approaches: 15.0 m.
(8) Water Density: Brackish water, density 1013 – 1023.
(9) Berthing allowed in daylight only from sunrise to sunset.
(10) Bunkers not available. Fresh water available at the oil berth.
(11) No limitations on freeboard, but limited by above given parameters.
(12) Concrete Quay: Length 120 m. Rubber fenders at intervals. Vessels' mooring lines to bollards ashore.
(13) —
(14) Lighterage not available.
(15) Cargo Handling: Fuel oil, all grades of diesel oil. All grades of gasolene.
(16) Dirty ballast facilities available, capacity 300 cu.m.
(17) Slops are not accepted.
(18) 3 tugs available, 1,350 h.p. each. As per Harbour Master's rules, all types and sizes of tankers for mooring/unmooring are obliged to use 2 tugs.
(19) —
(20) Pilot Boarding Position: Lat. 43° 01′ N., Long. 17° 23′ E., about 1.5 miles Westward of Rt. Visnjica.

Dominican Republic

RIO HAINA: (Also see Page 569) (See Late Plans)

SHIPMASTER'S REPORT: September 1994.

Vessel (On arrival):

LOA: 226.25 m.
Breadth: 32.2 m.
Depth: 19.6 m.
Cargo onboard: 24,995 tonnes of fuel oil.
D.w.t.: 31,749 tonnes.
Displacement: 45,905 tonnes.
Draft: Forward 26 ft. 9 in., aft 27 ft. 2 in.

Restrictions for Rio Haina:

(AA) Max. draft: 29 ft. Fresh water and even-keel.
(BB) No max. length given. When asked, Pilots/Port did not have a dedicated figure. Pilots/Port said vessel was OK for berthing.
(CC) Tankers only berth/unberth in daylight.

Vessel arrived on 1st September at 0230 hrs. Pre-arrival ETA's and messages to Agents had not been acknowledged by them. Called Pilots/Port on VHF prior to arrival, and after arrival, but no reply until 0530 hrs., when we were advised that the Pilot would board at 0700 hrs. at the pilot station, which is about 3 nautical miles South of the port.

Pilot boarded at 0724 hrs. His knowledge of English was limited, but sufficient.

We entered the harbour through the entrance (buoyed channel), came astern on the engines, dropped starboard anchor, and the tugs manoeuvred vessel alongside.

As per plan, our berth was just inside the entrance. Sufficient speed is required to pass through the narrow entrance channel (the tugs wait inside for the ship) followed by the need to stop as quickly as possible (There was about 10 m. clearance either side of the ship when passing the entrance buoys). Therefore as soon as we were inside the harbour, it was engines up to full astern and drop the starboard anchor. The 2 tugs (3,000 h.p. each) then attended to assist in working us alongside, although neither made fast. Ship's engines and anchor were utilised in conjunction with the tugs to bring the ship alongside.

The jetty was of solid concrete construction, fitted with large tyre fenders only. It was important to bring the vessel slowly and squarely in to the jetty to prevent any part of the ship falling in between the fenders and contacting the jetty.

Approaching the berth, a mooring boat attended to assist in running lines. The first lines were head lines.

Final moorings were as per plan.

Once in position, the forward part of the vessel was ahead of the forward end of the jetty, and the head lines really were more like breast lines. All line handling ashore was by "hand power", but there was sufficient manpower to enable the job to be done in a reasonable time.

Once alongside, the anchor was slacked until there was no weight on the cable. At this time, there were 4 shackles on deck. We expressed our concern that the anchor itself was stuck out in the middle of the harbour with ships passing over it. Pilot said all was OK and no other deep draft vessels would be passing over it during our stay.

Wind was N.N.E. to East during our stay, which kept vessel nicely alongside in conjunction with the moorings.

1×8 in. hose was connected.

The ship's accommodation ladder was lowered to the jetty for access.

Ratguards were fitted to all moorings, and hawse pipe guards were in place.

Agents, Authorities, surveyors, etc., were all friendly, and no problems were encountered.

The Agents advised they could be contacted via VHF, or could be telephoned from the Pilot's office, which was about 200 m. from the ship.

Two shore police officers were arranged by the Agent for security. These turned out to be useful, as during the first night alongside there were 2 separate instances of thieves climbing the mooring ropes and gaining access to the main deck. Fortunately on both occasions they were spotted by ship's staff and shore security, and they quickly fled, once they realised they had been discovered.

Shore maximum back pressure allowed was 10 kg. Average discharge rate was 4,800 bbls./hr. The shore line was 10 in. and discharge was into 2 shore tanks. The tanks were 0.6 km. away and at a height of 42 ft. above sea level. Communications with the shore were verbally across the dock.

Prior to departure, shore police boarded the vessel to carry out a stowaway search. The Pilot did not board until they had completed this search and cleared the ship. Ship's staff also carried out their own search.

On departure, all lines were let go and the anchor heaved in, which pulled the ship off the berth. The Pilot taking us out was the son of the Pilot who had brought us in. His English was very good. To prevent the stern swinging in to the jetty, engines and rudder were also used. The two 3,000 h.p. tugs attended but did not make fast. The vessel went ahead to the widest part of the harbour (See "Plan") and turned to port, with one tug forward and one tug aft pushing. Engines were utilised to keep the vessel positioned during the turn. The bow of the ship passed approximately 20 m. clear of the adjacent jetty, although there was some more room to play with aft. Once turned around, the tugs stood-off and the ship gathered speed to transit the channel. Once clear, the Pilot disembarked.

Arab Republic of Egypt

SUEZ CANAL: (Also see Page 607)

RULES OF NAVIGATION:

SECTION II:
Articles 52, 53 and 54:

Increase of Maximum Draft:

The following is taken from Circular No. 6/94, dated August 1st 1994, issued by the Suez Canal Authority, Ismailia.

"As further dvelopment of the Suez Canal has been completed, the Suez Canal Authority is pleased to inform Canal users that:

1. Vessels of up to 158 ft. beam will transit the Canal drawing a 56 ft. draft.
2. Vessels of more than 158 ft. beam will transit the Canal at drafts shown in the tables which follow.
3. Ballasted vessels of up to 210 ft. beam will transit the Canal at a draft of up to 31 ft. forward and up to 35 ft. aft.

However, ballasted vessels of more than 210 ft. beam will still transit the Canal at above mentioned draft, provided that transit takes place in favourable weather conditions and clear visibility with wind velocity not exceeding 10 knots.

4. This Circular will take effect as from October 6th, 1994.

ACAJUTLA: (Also see Page 617) (See Late Plans)

SHIPMASTER'S REPORT: September 1994.

The "Chubasco" season runs from about May to October, and is a local, very violent wind/squall which can attain 80 knots. It blows up with little warning in 15-20 minutes, and apparently rarely lasts for much more than 30 minutes. It is accompanied by heavy rain and extensive lightning. The locals are extremely wary of it, and we were required to maintain full radar watches by a deck officer for 24 hours a day. A Pilot boarded the vessel at evening twilight and departed after breakfast. Additionally, a Loading Master was on duty at all times, maintaining walkie-talkie communications with the shore. When the O.O.W. detected a squall approaching by radar, Pilot and Loading Master were informed. Discharging ceased when wind speed reached 8 knots, and hose was disconnected if wind speed reached 15 knots. A squad of 5 labourers remained on board for this period.

Due to the ferocity and abrupt arrival of "Chubascos", mooring ropes must be used as in an emergency, they may have to be cast-off to enable the vessel to vacate the berth rapidly. Mooring wires are not permitted. 3 tugs available for mooring.

Minimum depth of water (by echo-sounder) at berth and on approach is 15.0 m. There was a heavy swell running the whole time.

Due to a recent accident (June 1994), discharging was by way of 1×8 in. hose on the port side, rate about 5,000 bbls./hr., the normal crude line being damaged.

Facilities exist for repatriation.

Circular Letter:

To: Master.

From: Refineria Petrolera Acajutla, S.A. de C.V., RASA Marine Terminal, Acajutla.

Subject: Precautions against bad weather conditions at Acajutla, during "Chubasco" Season.

Dear Sir:

We would like to ensure the safe and efficient turnaround of your vessel at our Marine Terminal. There are no weather forecast facilities at or near the Acajutla Port to provide you/us with this important service. However, a local storm called "Chubasco" requires special precautions to be taken, in order to avoid the possibility of damage to the ship or to RASA's all-buoy Marine Terminal facilities, or the Ecology, and related clean-up costs.

As a result of past experience of sudden violent rainstorms called "Chubascos", which are highly likely to reach your berthing area during the rainy season, from May to October, we strongly recommend the following precautionary measures be strictly followed during your tanker operation while at our Marine Terminal.

1. Request the Pilot from the local Port Authority to remain onboard your vessel at all times during the "Chubasco" season.
2. A radar weather watch should be maintained continuously from about 2 hours before sundown to sunrise, in order to detect and plot "Chubascos".
3. During the same period, your deck crew should be prepared to run out the mooring lines off the winches or bitts, and leave the berth without tugs or mooring launches. Your engines should be ready for immediate use.
4. In case of emergency evacuation of berth unassisted by tugs, we suggest the use of your starboard anchor to aid you in leaving the berth.
5. For the safety of our Terminal underwater facilities, it is of utmost importance to have the ship moorings in good condition and well tended at all times.
6. If a storm, that may be a "Chubasco", appears at a distance of 25 miles, all cargo operations should be stopped. Our Loading Master will drop hoses as is required in his procedures.
7. In such event, all personnel involved should be immediately advised of the change in weather conditions so that emergency procedures can be timely put into effect. RASA's shore personnel must be advised by radio immediately.
8. Radio communications should be maintained open with the Refinery Process Control Room at all times. "Chubascos" are known to interfere with radio communications. Timely advice is most important for our shore personnel to co-ordinate emergency activities.
9. In order to avoid the possibility of damage to the ship or to RASA's all-buoy Marine Terminal facilities, we hereby request you maintain a *minimum midships draft of 20 ft. at all times* during your berthing and crude discharge.
10. Kindly confirm with our Loading Master the time at which you will commence your ballasting operation. Also advise our Loading Master if the vessel cannot comply with any of the above precautionary measures.

Please sign the attached copy and return it to our representative in acknowledgement of the contents of this letter.

Signed: Process Manager.

Developments: Paktank Terminal in "New Port" partly completed in Summer 1993. Storage expected to be completed in 1995.

Neste and National Estonian Oil Company intend to build storage facilities in "New Port", 1993/1994 50,000 cu.m., thereafter another 50,000 cu.m.

Swedish company "Nordic Storage" intends to construct a terminal in "New Port".

A small Finnish Lub Oil storage facility under construction.

Scantrans intends to expand in their "Old Port" capacity from 20,000 cu.m. to 90,000 cu.m.

France

GENERAL: (Also see Page 655)

CUSTOMS: *Shipmaster's Report:* September 1994.

The French Customs Regulations have been changed as follows:

The Stores and Provisions List now has to be made out in triplicate.

The attached Crew Declaration (on the new form on the backside of the Stores and Provisions List) also to be made out in triplicate.

Vessels may open the bonded store between French ports (as in our case between Dunkirk and Port Jerome), but the above mentioned lists have to be submitted in both the first and the following port(s).

Gabon

OVENDO (Owendo): (Also see Page 709)

(See Late Plans)

SHIPMASTER'S REPORT: September 1994.
Circular Letters from Agent:

WARNING TO CAPTAINS OF ORE CARRIER VESSELS BERTHING AT OWENDO TERMINAL

Captains of ore carrier vessels berthing at Owendo Manganese Terminal, are hereby advised by COMILOG, as Owner of the Terminal, that vessels are systematically submitted to strong currents when berthed at the Terminal, especially during the ebb period.

Therefore, they are kindly requested to stick to Pilot recommendations, to double mooring ropes and, when the current is becoming stronger, to keep a crew member on watch.

In case of damage to the Terminal caused by the vessel, COMILOG will keep the Owner, or disponant Owner of the vessel, fully responsible.

Dear Captain,
The characteristics of our ore port do not allow crew to move about freely from vessel on shore. For moving, it is necessary to take a shuttle boat and for this purpose, COMILOG envisages to put in its place a boat service. The tariff is as follows:

One Trip	Quay/vessel/quay, during working days (0700 hrs. – 1800 hrs.):	FF 1,113.00
One Trip	Quay/vessel/quay, Sunday/holidays:	FF 1,669.50

Editor's Note:
100 FCFA = 1 French Franc.
500 FCFA = U.S.$ 1.00.

Guinea-Bissau

BISSAU: (Also see Page 789)

SHIPMASTER'S REPORT: September 1994.
Pilotage: Pilot has to be arranged by Agent.

The pilot station on Caio Island has no means of communication with vessel. No pilot boat available.

Vessel's lifeboat has to be used to pick-up Pilot on East side of Caio Island.

Great care has to be taken due to many breakers and strong current. It is not recommended to try it in bad weather.

Pilot speaks no English.

All navigation has to be done by ship's Master.
Radio/VHF: Bissau Radio only equipped with VHF Channel 16.
Tugs: No tugs available.
Berthing: New cargo pier (length 290 m.) completed and in use.
Holidays: August 3rd is also a national holiday.
Telephones: No ship-to-shore telephone available.

Indonesia

PANGERUNGAN: 06.58 S. 115.57 E.

REPORT: November 1994.

LOCATION: The S.B.M. at Pangerungan Marine Terminal is located in position Lat. 06° 58′ 14″ S., Long.115° 57′ 23″ E.

The first shipment of condensate was loaded in May 1994.
ANCHORAGE: Within the area bounded by co-ordinates A, B, C and D.
(A) Lat. 07° 00′ 00″ S., Long. 115° 56′ 00″ E.
(B) Lat. 07° 00′ 00″ S., Long. 115° 57′ 00″ E.
(C) Lat. 07° 01′ 00″ S., Long. 115° 57′ 00″ E.
(D) Lat. 07° 01′ 00″ S., Long. 115° 56′ 00″ E.
MAX. SIZE: The S.B.M. is prepared for handling tankers up to 125,000 d.w.t.
LOADING: Hose connection is 1×12 in., butterfly valve manifold.

Loading tankers should prepare their own hose connection for 12 in.

On export S.B.M., total length of hose string is 800 ft., so for tankers intending to load condensate, the distance from bow to loading manifold should not exceed 490 ft.

Loading Rate: 3,500 - 6,500 bbls./hr.
Details of an October 1994 loading:
Loading Rate (Average): 5,952 bbls./hr.
Loading Temperature (Average): 88.3°F.
API Gravity 60°F: 61.38.
Specific Gravity 60°/60°F: 0.7336.
GENERAL: The General Agent arranges foreign flag vessel permit to enter Indonesian waters against Sea Commercial Department. Pertamina Shipping must be appointed as Port Agent as Terminal is owned/operated by Arco/Pertamina (See "General" before first port).

TANJUNG GEREM: 05.58 S. 105.59 E.

REPORT: November 1994.

PILOTAGE: Compulsory. Call pilot station when approaching Terminal.
ANCHORAGE: 0.5 miles off wharf.
MAX. SIZE: 35,000 d.w.t.
BERTHING:
Wharf No. 1: Lat. 05° 58′ 17″ S., Long. 105° 59′ 18.4″ E.
Wharf No. 2: Lat. 05° 56′ 24.5″ S., Long. 105° 59′ 14.4″ E.
Depth of Water: 13.0 m.
LOADING: First vessel expected to load on 9th November 1994.
Loading Arm Size Connection:
Wharf No. 1: 6 in.
Wharf No. 2: 10 in.
Shore Tanks:
Kerosine: 2×10,000 kilolitres.
Gas Oil: 5×10,000 kilolitres.
OPERATOR: Pertamina.

Iran

BUSHIRE: (Also see Page 955)

REPORT: October 1994.

The following information was given to a Master on arrival by the Port Authority.
Documents: Crew List, Health Documents, Manifests, Bill of Lading and all necessary Certificates, such as Safety Equipment, I.O.P.P., etc.
Pilotage: Pilotage for all foreign vessels of any tonnage, and Iranian ships above 60 g.r.t., is compulsory. Request Pilot from Bushire Port Control on VHF Channel 16.

Advance notice of ETA is required at least 10 hours before reaching Bushire Anchorage, either via VHF or 500 kHz. Pilotage is available throughout 24 hours.
Anchorage: Outer Anchorage is about 0.5 miles from the Fairway Buoy (No. 1). The depth of the water is about 12.0 m.

Inner Anchorage is suitable for small vessels (max. LOA 100 m.). Max. depth is 5.5 m.
Bushire Channel: From entrance of the channel to the Oil Jetty in harbour area is about 7 miles. The width of the channel is 140 m. and there is a sharp bend (curve) between Buoys No. 11, 12, 13 and 16, of about 110°. The maximum LOA for entry is 200 m. and the maximum draft for vessels of 185 m. and above (max. LOA 200 m.) is 27 ft., and for vessels less than 185 m. LOA, draft is 28.6 ft. The direction of the current is from the sides.
Berthing:
Oil Jetty (North Pier): Length 64 m. Depth 7.5 m.
Dolphins: Max. depth 6.0 m. (for lightering).
Pier No. 1: Length 174 m. Max. depth 8.4 m.
Pier No. 2: Length 174 m. Max. depth 8.8 m.
New Jetty: Length 286 m. Max. depth 4.0 m. Suitable for small ships.
Petrochemical Jetty (QODS Pier): Max. depth 5.0 m.
Persian Marine Jetty (for small craft and barges): Length 80 m. Max. depth 3.0 m.
Tugs: Towage undertaken by Bushire Port Authority with tugs of variable horse power.
Fresh Water: Supplied and delivered by special barge, inshore and offshore. Rate of delivery about 40 t.p.h. Cost 50 Rials/cu.m.
Surveyors: Cargo inspectors and ship surveyors are available.
Bulk Handling Facilities: Operated by private companies. Other facilities, such as shore cranes with various capacities and trucks, etc., are available from Port Authority.
Airport: Bushire Airport for domestic flights is about 5 miles from the port. There is a daily flight to Tehran. On Wednesdays, there is an extra flight to Tehran via Shiraz and Isfahan.
Police/Ambulance/Fire: Call Bushire Port Control on VHF Channel 16 and ask for service required, both in anchorage and in port.
Banks: Bank Melli or Iran.
Shore Leave: The crew are allowed ashore, in accordance with Regulations of the Customs Police (Master: 0800 hrs. – 1200 hrs. and 1600 hrs. – 2000 hrs. Crew: 1600 hrs. – 2000 hrs.).
Regulations: All particular and Islamic regulations should be respectfully obeyed by crew during their stay in port and whilst ashore.
General: All vessels at the time of arrival are inspected by Customs Police and Health Authority (Quarantine), and their radio aids, except VHF, are sealed by the Communications Department.
Authority: Bushire Port Authority. *Tel:* (0771) 22051-7. *Telex:* 332108 BDBUIR. *Contact:* Captain M.R. Golkar, Harbour Master.

Japan

GENERAL: (Also see Page 1059)

SHIP'S OFFICER'S REPORT: October 1994.
Radio Pratique: (Official Notice)

RADIO PRATIQUE PROCEDURE

Vessel desiring Radio Pratique must possess a valid Sanitary Inspection Certificate and send Radio Pratique message through the Agents to the Chief of the Quanrantine Station from 36 to 6 hours prior to arrival (Saturday, Sundays and Holidays not counting).

To obtain a Sanitary Inspection Certificate, the vessel must submit, through the Agents, a written application to the Chief of the Quarantine Station, practising Radio Pratique. A Sanitary Inspection will thereafter be carried out to ascertain the sanitary conditions on board, including any existence of rodents and/or vectors, the handling of food and beverages, etc. If the vessel's sanitary conditions are found satisfactory, a Sanitary Inspection Certificate will be issued on Form No. 9 under the regulations of the Quarantine Law, valid for 12 calendar months.

The message from the vessel requesting Radio Pratique should include the following information:

(1) The intention for requesting Radio Pratique in accordance with Clause No. 2, Article 17, of the Quarantine Law.
Example: RPM.
(2) The vessel's name and nationality (Unnecessary, include in the message).
(3) The serial number of the Sanitary Inspection Certificate:
Example: 011005.
(4) The name of the port where the vessel commenced her sea voyage and the date of departure therefrom.
Example: Losangeles 1st Mar.
(5) The name(s) of the port(s) the vessel called at within 15 days prior to her arrival in Japan, and the date(s) of departure therefrom.
Example: Pusan 15th Mar.
(6) The name of the port the vessel is scheduled to enter in Japan, and the ETA.
Example: Kobe 25th Mar.
(7) When and by whom the Derat Certificate was issued.
Example: Yokohama 1st Dec. 72 exemption (or deratting).
(8) Number of crew members and passengers.
Example: Crew 28 Pax nil.
(9) Whether or not the vessel received on board any person or article from another vessel or an aircraft within 15 days prior to the arrival in Japan, and if so, full details.
Example: None.
(10) Whether or not the vessel had any sick person on board within 15 days prior to arrival in Japan, and if so, full details.
Example: None.

(11) Whether or not anybody died on board within 15 days prior to arrival in Japan, not caused by an accident, and if so, full details.
Example: None.

(12) Whether or not rat infected with plague or suspected infected within 15 days prior to arrival, also whether or not rats onboard have been discovered dead from abnormal reasons during the voyage.
Example: None.

(13) Whether or not vessel has any articles on board contaminated with an epidemic virus.
Example: None.

(14) Whether or not there are any crew members or passengers on board who are not in possession of valid Smallpox Vaccination Certificate.
Example: None.

(15) Whether or not the vessel has a surgeon on board.
Example: None.

(16) Master's full name.

If the Items 9 to 14 (or 15) are all "None", the message can be summarised "9 to 14 (or 15) None".

The example of the Radio Pratique message is as shown below:

"RPM 011005 Losangeles 1st Mar Pusan 15th Mar Kobe 25th Mar Yokohama 1st Dec 72 Exemption Crew 28 Pax Nil 9 to 15 None (Master's full name)".

The ports which as of April 1973 are practising Radio Pratique are as follows:

Otaru, Muroran, Hakodate, Niigata, Fushiki, Toyama, Chiba, Yokohama, Kawasaki, Tokyo, Shimizu, Nagoya, Yokkaichi, Shimotsu, Wakayama, Sakai-Senboku, Osaka, Kobe, Mizushima, Hiroshima, Tokuyama-Kudamatsu, Kanmon (Shimonoseki, Moji, Kokura, Tobata, Wakayamasu, Yawata), Hakata, Sasebo, Nagasaki and Kagoshima, in North to South rotation.

No Radio Pratique will be granted to vessels falling under any of the following categories:

(1) If within 15 days prior to arrival in Japan:
  (a) The vessel called at a port in an area where plague is actually prevalent or feared to become prevalent.
  (b) The vessel received on board any person or article from a vessel or an aircraft which had called at a port as described under (a).
  (c) The vessel has on board a sick or dead person suspected infected with a contageous disease.

(2) A rat is found on board suspected to have contracted a contageous disease, or a rat is found dead from abnormal reasons.

(3) Any crew members or passengers are without valid Smallpox Vaccination Certificate.

(4) The vessel has no valid Derat Certificate.

(5) The vessel carries on board cargo which could be in danger of being contaminated with an epidemic virus.

(6) The vessel has no valid Sanitary Inspection Certificate on board.

Anchorages: Osaka and Tokyo Bay:

The application form should be handed to Customs by the Agent in advance to drop anchor within harbour limits. Otherwise the vessel should ride at anchor outside of harbour limits, in which case the pilotage fees will be higher.

Customs Formalities: Osaka and Tokyo Bay:

The Agent in Japan has to pass through Customs formalities within 24 hours from the time of the vessel's arrival, except Saturdays, Sundays and national holidays. That is why they attend the vessel to receive cargo documents or ask vessel to adjust the time of arrival in the port.

Kuwait

MINA ABDULLA: (Also see Page 1218)

SHIPMASTER'S REPORT: September 1994.

Anchorage: On arrival, while awaiting berth or awaiting tide, vessel can anchor 2.0 – 2.5 miles East of Sea Island.

Berthing/Unberthing: Mina Abdulla Sea Island has 2 berths (No. 18 and No. 19). On both berths it is always port side alongside.

On Berth No. 19 (which is seaward), berthing and unberthing is always done during ebb tide, i.e. heading into a stream which is approximately S.S.E. going. Similarly, on Berth No. 18, docking/undocking is always during flood tide, i.e. heading into a stream which is approximately N.N.E. going. Max. rate of stream is about 2 knots. Two tugs are used for berthing. No tugs used for unberthing. Pilot boards about 1.5 miles E.S.E. of Sea Island for Berth No. 19, and usually 1.5 miles E.N.E. of Sea Island for Berth No. 18. Moorings used are 3-3-2 forward and aft. There are no mooring boats, and all lines are sent ashore to dolphins by heaving lines. Complete operation of positioning vessel, aligning manifolds and mooring takes a long time.

For undocking, Pilot boards from Terminal, but a ladder should be kept ready for his disembarkation as he leaves a few cables off Sea Island.

Ship-Shore Access/Communication: Shore gangway is always used. During cargo operations, ship's portable radio is kept by Terminal Control for ship/shore communication. Terminal Control also keeps continuous watch on VHF Channel 69.

Terminal Facility and Operations: Shore connections are of 12 in. All loading arms are Chicksans with quick connector couplings. Usual rate of loading is 2,000 tonnes/hr. Usually only one loading connection is provided. However, under exceptional circumstances, 2 connections can be given. Minimum rate of loading for topping-up is 500 tonnes/hr.

All white products (ATF, AGO, HSDO and SKO) are handled.

There is no slop reception facility at Terminal.

Surveyors/Sampling: Saybolt are usually the surveyors appointed on behalf of suppliers (KPC). "First Foot" sample is usually drawn from first ship's tank loaded. Colour specification is very important. If sample is not absolutely clear visually, loading is suspended for about one hour until sample is analysed in laboratory and found satisfactory and within specification.

Documentation: EDP is always followed after completion of loading. Vessel has to cast-off immediately if tide is available (i.e. ebb tide on Berth No. 19). If however tide is not available, vessel remains alongside and documentation can be completed there. If casting-off immediately, vessel can anchor 2.5 miles East of Sea Island and await documentation. If anchoring is not desirable, vessel can authorise Agents to sign documents and proceed on her voyage. Shore cargo figures are advised to vessel on VHF.

Terminal staff/Loading Master do not sign any papers (e.g. Cargo Nomination or Protest Letters, etc.), nor do they issue any Protest Letters. KPC representative boards vessel after completion of loading, either on berth if vessel stays on berth awaiting tide, or at anchorage if vessel anchors for documentation. He signs all documents "For Receipt" on behalf of KPC.

Agents: Agent board vessel once after berthing and once before unberthing, and hands over the Port Clearance. He must be given one hour's notice before completion of loading.

Bunkers: Bunkers are available ex-pipe and ex-barge. Sometimes, required grade is not available from Terminal ex-pipe, then vessel has to obtain required grade by barge at anchorage. Bunkering ex-pipe can be done concurrent with cargo loading. Barges are not allowed to come alongside when vessel is at berth. Barge supplies bunkers at a rate of approximately 300 tonnes/hr. If bunkering by barge, it is preferable to do it at anchorage after loading, as documentation is also accomplished while vessel receives bunkers.

Routeing: Deep Water Departure Channel (QCR 305) should be used for sailing out of Mina Abdulla, even if vessel can safely navigate through "QCR 302", as no inbound ships are allowed through "QCR 305". This channel is very wide and all buoys were found in position.

Regulations/Miscellaneous: Alcohol and "Magazines" must be sealed prior to arrival. Some of the European ladies fashion magazines can also be regarded as "pornographic". Cameras must also be sealed. Radio Free Pratique is not granted and "Q" Flag must be kept hoisted until Pratique granted after berthing. However, it is still recommended to send Radio Health/Pratique message to Shuaiba Health Office via Agent.

Shore leave has to be arranged by prior notice/permission. List of persons wishing to go ashore has to be sent to Agents prior to arrival, and they should also be in possession of a photograph. Persons needing medical attention can however be sent to doctor, even if no prior arrangements are made.

MINA AL-AHMADI: (Also see Page 1220)

SHIPMASTER'S REPORT: November 1994.

Gas Berth:

Documents:

Copies of all Safety Certificates.
Copy of Certificate of Registry.
Last Port Clearance.
Maritime Declaration of Health.
2 copies Crew List.
1 copy Crew Declaration.
1 copy Bonded Stores List.
1 copy Vaccination List.

Note: 6 men had to go ashore for Cholera vaccination which is still required in Kuwait, Vaccination Certificates checked.

Radio: Pre-arrival message received from Agent:

Quote:

For Master only.

Maximum stern trim for berthing operations not to exceed 3.0 m.

Please acknowledge and advise the following (please use metric units):

(1) ETA.
(2) Last port of call.
(3) Deballasting time, type and quantity to be discharged at Kuwait. Is oil discharge monitoring equipment operational?
(4) Loading capacity while deballasting.
(5) Maximum loading rate.
(6) Bunker type and quantity required.
(7) Arrival draft in meters (forward and aft).
(8) Sailing draft in meters (forward and aft).
(9) Maximum loaded draft in meters.
(10) LOA.
(11) Beam.
(12) Light freeboard.
(13) Arrival displacement in metric tons.
(14) Sailing displacement in metric tons.
(15) Fully laden displacement in metric tons.
(16) Summer deadweight in metric tons (as per Tonnage Certificate).
(17) Year built.
(18) G.r.t. and n.r.t. as per Tonnage Certificate.
(19) Flag.
(20) Date of last call to Kuwait.
(21) Ship's call sign.
(22) Your P&I Club and their local representative.
(23) All your requirements.
(24) Please advise unique Bill of Lading Identifier No., if required to insert in the original Bill of Lading documents.
(25) Please contact your Agents "Minatank" 6, 4 and 2 hours prior to your arrival at anchorage by VHF Channel 16, 20 or 21.

(26) For crew coming ashore, please advise 48 hours in advance, full name without initials, passport details, CDC No. groupwise, each group not to exceed 12 persons.

(27) For security reasons, using cameras/video cameras is strictly prohibited by Port Authorities when your vessel at anchorage/berth. Also while crew coming ashore, no crew should be in possession of pornographic magazines, alcoholic items, or any other obscene material, including weapon items, cameras/video cameras. Anybody breaking the law will be prosecuted.

(28) Please contact Mina Control, 2 or 3 hours prior arrival by VHF Channel 69 for berthing/anchoring instructions.

(29) In order to inform shippers/Owners/Charterers correct position of vessel, you are kindly requested to inform us the following details by telex everyday noon while you are loading:
  (a) Exact time of commencement of loading.
  (b) Estimated time of completion of loading.
  (c) Cargo quantity received on board.
  (d) Grade of cargo.
  (e) Balance cargo to be loaded.

N.B.: Failure in advising above details may cause unnecessary delays.

Please contact us on:
VHF Channel 16: Calling.
VHF Channel 20/21: Operating.
Telex: (496) 44201/44202.
Fax: (009650) 3921135/3922014.
Satcom: (583) 494190010.
Or our Head Office: Telex: (496) 22013/44766/44755/30850.
Fax: (00965) 2445693/2445907.

(30) We have pleasure to inform you that we have mobile telephone available on rental basis to communicate with all over the world. The rent is KD.15/day plus 20% of original invoice of "Ministry of Communications". Please advise if you require.

(31) Please fax or telex your Crew List prior to your arrival.

Quarantine: No inspection at anchor. Signal must be displayed, "Q" flag by day and "red above white" light during darkness.

Galley and storerooms inspected before Pratique granted.

Customs officers, cargo surveyor and shore gang will not board until Pratique is granted.

VHF: Call "Mina Al-Ahmadi Port Control" 5 hours before arrival on VHF Channel 16, working channels are 69 and 73.

Navigation: Approaches are through a swept route which is 50 miles long and has a minimum width of 1.5 miles. Outbound vessels use a separate swept route 50 miles long with minimum 1 mile width. Both are well buoyed and have sufficient fixed navigational marks with Racons to make the approach relatively simple. All Racons operational and buoys in charted position.

Minimum charted depth inbound 18.9 m. and outbound 20.2 m.

Anchorage: Anchorage for LPG vessels 2 miles East of Southern Pier in 20.0 m. Bottom is soft clay and good holding ground. Pilot not required for anchoring.

Berthing: Invariably starboard side alongside.

Pilot boards from pilot boat (accommodation ladder/pilot ladder combination required) in position 1.5 miles N.E. of North point of South Pier.

Tugs "Hazim" and "Bayan" used. Tugs make fast immediately on pilot boarding, forward tug at break of fo'cs'le port side, aft tug at front of accommodation block (port side). 2 tugs' lines used, tugs push only. Messengers should be used for tugs' lines as ropes are substantial.

Pilot stops ship 3 cables off, and lying parallel to berth. Tugs push vessel onto berth, ship's engines used to maintain position relative to loading arms. Tug Masters competent and quick to respond to instructions.

Mooring: All wires should be fitted with nylon pennants. Moorings sent by heaving line/messenger.

Ship sends heaving lines as soon as possible, shore bend on messengers which are heaved onboard. Shore pick-up on messengers using good capstans.

Final positioning is undertaken using 2 springs fore and aft, springs are first lines ashore and made fast before further moorings are run. Final moorings are 3 head/stern, 2 breasts, 2 springs. Breast and spring moorings should be wire. Head and stern moorings may be polyprop, nylon (spooler) and/or wire.

Mooring operation takes approximately 1 hour.

Berth: Lies 172° – 352°, and is well fendered with wooden fenders attached to shock absorbing pistons. All fenders in good condition.

Breast moorings are secured to quick-release hooks which are all operational. There is ample shore labour.

Springs and head/stern lines on bollards.

Gangway: There is no shore gangway, but if accommodation ladder is lowered, the shore place a "brow" gangway of aluminium construction from shore onto bottom platform of the accommodation ladder.

Loading Arms: Configuration from South (forward to aft starboard side alongside): Propane Vapour – Propane Liquid – Butane Liquid – Butane Vapour. All connections are 16 in. 150 ASA bolted flanges. Shore gang connect up.

Due to shore configuration, ship must fit conversion bends.

Loading: Jetty Operator is given ship's portable VHF radio (walkie-talkie).

Load Butane and Propane concurrently.
Propane specific gravity 0.5072 at 60°F.
Butane specific gravity 0.5774 at 60°F.

Propane loading temperature was −39°C, which caused excessive vapour generation and attendant difficulties for ship.
Butane loading temperature was −4.5C.

We received no information from shore regarding quantity loaded, etc. Understand from talking to SGS Surveyor that shore tanks require some maintenance with respect to gauging equipment and temperature probes.

Bills of Lading produced on arrival by Agent's Boarding Clerk. Bills of Lading indicate only 3 originals signed by Master, but in fact they are all originals. Seek guidance Charterers instructions.

EDP is mandatory at this port.

Agent and Loading Master do not board prior to sailing, so no signatures possible on 19 L or Letter of Protest.

On completion of loading, loading arms are drained to shore, so no requirement for ship to "hot gas" to shore, or for shore to push nitrogen into ship's system. Disconnection takes about 3 hours.

Sailing: On completion of disconnection, call Agent "Minatank" on VHF Channel 20, and they will order Pilot and tugs; takes about 20 minutes before Pilot boards.

In fair weather, tugs are not required for unmooring.

Pilot takes ship off berth and disembarks immediately.

At time of writing, 36 hours after sailing, Bill of Lading details have not been received.

Latvia

LIEPAJA: 56.32 N. 20.59 E. (See Late Plans)

PORT LIMITS: A vessel is considered an "arrived ship" usually upon reaching the pilot station.

DOCUMENTS:
4 copies Crew List.
2 copies General Declaration.
1 copy International Maritime Declaration of Health.
1 copy Tonnage Certificate.
1 copy Master's Declaration, filled out by Agent.
1 copy Documents concerning Cargo on Board.
Derat Certificate.

RESTRICTIONS: Entry usually allowed around the clock. Large vessels are allowed to enter in daylight only.

MAX. SIZE:
City Canal: LOA 125 m.
Draft 6.0 m. (+0.5 m., depending on wind).
Free port: LOA 200 m.
Beam 30 m.
Draft 8.5 m.

HEALTH: Sanitary inspection undertaken when arriving from a foreign port. In the event of a disease on board, vessel can anchor in Inner Roads, upon vessel receiving a special permit from Harbour Master. Upon vessel's arrival, doctor and Agent board to fill out the Maritime Declaration of Health.

RADIO/VHF: ETA information usually provided by telex communication via Agent. Vessels approaching the port shall contact Vessels Traffic Service on VHF Channel 11. Same channel is used for applying for tugs and Pilot.

RADAR: Port Radar Service is available on VHF Channel 11.

TUGS: 4 tugs available: 1,500 h.p., 900 h.p., 600 h.p. and 450 h.p.

BERTHING:

Berths No.	47 – 51	Under reconstruction (depth 9.0 m.)
	40	Metal, timber, packed wood.
	41 – 42	Timber (pulpwood, logs).
	55 – 60	Timber (pulpwood, logs).
	73 – 78	General cargo (steel bundles, packed timber, fertilisers in big bags) and refrigerating plant.

BULK CARGO FACILITIES: "Duna" (Berths No. 62-63): Bulk cargoes from railcars (graphite, broken stone, peat, etc.).

LOA 120 m. Draft 6.0 m.

SPECIALISED CARGO HANDLING FACILITIES: There is a Ro-Ro Terminal at Berth No. 46.

The port has no facilities for handling chemicals (except in big bags).

BRIDGES: On entering Tosmare Canal, the turn-out bridge is opened as required.

STEVEDORES: Usually work round the clock. Average load/discharge rate is 800 tons per day.

MEDICAL: Advance notice of medical assistance required by Agents, but not obligatory. Agents can arrange for all necessary medical assistance. All inoculations and vaccinations can be carried out, if necessary.

TANKERS: 3 berths for tankers up to 5,000 d.w.t. and draft 6.0 m. Prevailing wind on berth is onshore. Special moorings are not required. There is a boat for collecting dirty water (capacity 30 tons). Shore steam is not available.

DENSITY: Salinity depends on wind as City Canal connects the sea with a lake. There is sea water in the port.

FRESH WATER: Available by trucks and tug, and via shore connections. Cost approximately U.S.$3.00 per ton.

FUEL: Four days notice required for large quantities. Delivery by barge.

CONSULS: Only Russian consul in Liepaja. Consulates of several other countries are situated in Riga, the capital of Latvia.

REPAIRS: All types of repairs normally possible. There are 2 shipyards with dry docks.

DRY DOCKS: 2 dry docks available. The larger is 200 m. length and has a width of 21.0 m.

1 floating dock with length 100 m. and capacity 2,200 tons.

SURVEYORS:
(a) Cargo inspectors (SGS, Baltic Kontor Ltd., Independent Marine and Cargo Surveyors, Average Agents).
(b) Russian Register of Shipping representatives available, they can act as representatives of Lloyd's Register of Shipping, German Lloyd, Bureau Veritas on contract terms.

GANGWAY/DECK WATCHMEN: Not necessary but available.

CUSTOMS ALLOWANCES: One litre of any kind of spirits and wine, and 200 cigarettes for each crew member to be held out of bond.

REPATRIATION: Crew changes and repatriation possible.

AIRPORT: 7 km. from the city. Two international air routes, to Ronne in Denmark and Visby in Sweden. Numerous air routes available via capital city of Riga.
TIME: Local time is GMT plus 2 hours.
HOLIDAYS: January 1st (New Year's Day); April 1st (Easter); May 1st (Labour Day); June 23rd (Midsummer's Eve); June 24th (Midsummer's Day); November 18th (Declaration of Independence Day); December 25th (Christmas Day); December 26th (Boxing Day).

Additional cost charged for cargo handling on official holidays.
POLICE/AMBULANCE/FIRE: Police, Tel: 02; Ambulance, Tel: 03; Fire, Tel: 01.
EMERGENCY CO-ORDINATION CENTRE: Call VHF Channel 11.
TELEPHONES: Arrangements for placing telephones on board do not exist.
SERVICES: There is no tank cleaning equipment. Discharge of tank washings is possible. Services like compass adjusting, radio and radar repairs, supply of charts, nautical publications, sounding paper, course recorder paper, Notice to Mariners, safety equipment available and extention of certificates possible.
STORING: (See "Prelims").
(1) Vessel can be stored by truck. Trucks can proceed alongside the berth.
(2) Forklift trucks can be used on the jetty to handle stores.
(3) Local riggers can be used to assist with storing.
SHIP SUPPLY SERVICE: Not available.
SHORE LEAVE: Crew members are allowed ashore.
IDENTIFICATION CARDS: Seaman's Book is sufficient.
REGULATIONS: No unusual regulations for the port.
DELAYS: Delays can be expected in berthing and loading or discharging, if wind speed exceeds 12 m./sec.
DEVELOPMENTS: Port area is being developed.
AUTHORITY: Liepaja Port Authority, 9 Hikes Street, Liepaja, LV-3407 Latvia. *Contact:* Managing Director (Tel/Fax: 371-34-27605). Harbour Master (Tel/Fax: 371-34-24721).

Lebanon

GENERAL: (Also see Page 1236)

REPORT: November 1994.

Measures put in force concerning vessels
Arrivals and Sailings to and from Lebanon

Notice is given to:

1. All vessels entering the Lebanese Territorial Waters without presenting to the Maritime Chamber an application for permission to enter at least 24 hours prior to arrival. This application should be submitted by the licensed ship agent.
2. Entrance to the following ports: Tripoli, Beirut/Saida – Sour.
   2.1. Entering these ports should be carried out by navigating on course 090°.
   2.2. Sailing out from these ports should be carried out by navigating on course 270°.
   2.3. Entering and sailing out should be carried out within a lane not to exceed 3 miles opposite the relevant port.
   2.4. Sailing between these ports should be carried out within the Lebanese Territorial Waters at a distance of 3 miles from the coast, up to 12 miles deep.
3. Times of Sailing.
   3.1. Entering and sailing out from Beirut Harbour over 24 hours.
   3.2. Entering and sailing out to and from the following ports: Tripoli, Saida and Sour; between 0500 hrs. until 2000 hrs.
   3.3. Sailing between the Lebanese ports is limited between 0500 hrs. and 2000 hrs.
4. All ships entering or leaving the Lebanese ports should contact the Maritime Operations Rooms, as follows:
   4.1. On entering:
   First contact should be established at 12 miles from the port of destination.
   Second contact should be established at 6 miles from the port of destination.
   Third contact when arriving at anchorage off the port of destination.
   4.2. On leaving:
   First contact on leaving the point of berth.
   Second contact when arriving at 6 miles from harbour.
   Third contact when arriving at 12 miles from harbour.
5. Contact should be carried out as follows:
   5.1. On leaving and entering from and to the ports of Sour and Saida, contact to be made with the Combined Maritime Operations Room, Saida Branch, on call sign "O.S.".
   5.2. On leaving and entering from and to the port of Beirut, contact to be made with the Principal Maritime Operations Room, on call sign "O.C.".
   5.3. On leaving and entering from and to the port of Tripoli, contact to be made with the Combined Maritime Operations Room, Tripoli Branch, on call sign "O.N.".

Message from Agent to Shipowner (Dated July 1994):
Re: ETA Beirut.

Please advise Master to communicate with following on VHF Channel 16:

(A) Lebanese Navy Base ("Oscar Charley") when 12 miles off Beirut, then at 6 miles and at 1 mile.
P.S.: When sailing to and from Beirut, always remember Lebanese Territorial Waters are 12 miles. Also point of entry/exit should be on 270° of Ras Beirut. Failing to abide will result in fines. Furthermore, if this infraction is repeated, seizure of vessel is possible.
(B) Beirut Harbour Master, Bey Pilot Station and Marine Customs Brigade (G-4), when off Bey port.

Advising them:
1. Name/nationality of vessel.
2. Giving them Navigation Permit (No. . . dated . . . 1994).
Note: This number is allocated for registration for vessel M/V . . . . for this call only.
Please confirm.
Note: Master M/V . . . . to confirm receipt of above telex and vessel's Navigation Permit No. . . . . dated . . . 1994 by return telex.
Note: Master to advise in same telex available space left after discharging Beirut cargo (in TEU's) for loading empty/full containers from Beirut.

Also Master is kindly requested to advise if any full cargo to be discharged at Beirut and from which port. Your prompt reply would be much appreciated in order to telex you back details of recapitulation.

Message from Agent to Shipowner (Dated August 1994):
Re: Guidelines/Requirements – Bey Port.

We recapitulate herebelow guidelines/requirements to be adhered to by vessels when calling at Beirut:

I. Vessels sailing from/to Beirut should adhere to the following:
   (A) Lebanese Territorial Waters are 12 miles from the coast line.
   (B) Access route to/from Beirut is 270° off Ras Beirut Point.
   (C) When vessels enter Lebanese Waters, the Lebanese flag should be raised.
   (D) Vessels should communicate on VHF Channel 16 with Lebanese Navy Base ("Oscar Charley") when vessel is 12 miles from Beirut Port, and should give them the Navigation Permit Number and date issued for the respective call.
   We always communicate the Navigation Permit to the vessel well before arrival (Editor's Note: See message above). The vessel should also maintain contact with the Navy Base when the vessel is 6 miles and then 1 mile off Beirut Port.
   (E) The vessel should also communicate on VHF Channel 16 with Bey Harbour Master, Bey Pilot Station and Customs Brigade (G-4) when off Bey Port, advising them:
   (1) Name/nationality of vessel.
   (2) Exact ETA Beirut Port.

II. Documentation: On arrival, the following documents should be available in 6 copies, which should be duly stamped and signed by hand:
   (a) Cargo Manifest.
   (b) Recapitulation List of containers/weight of cargo for Bey discharge and containers/weight of cargo in transit.
   (c) Crew List (Note: Crew Passports or Seaman's Books should be available on arrival to check against Crew List).
   (d) Tobacco List (Crew members are allowed to keep 2 packets, repeat 2 packets, of cigarettes for personal use only).
   (e) Liquor List.
   (f) Passenger List, if any.
   (g) Mail List.

III. Port Operations:
   (A) From May to October, it is usually possible to enter, berth and start operations up to 2100 hrs. During Winter and depending on weather conditions, it is possible to enter, berth and start operations up to 2000 hrs. If vessel arrives later, she will have to remain off Bey Port to berth the following morning to start operations.
   (B) Operations can only start after vessel obtains Free Pratique, normally about 1 hour after berthing.
   (C) Operations, when started, can be maintained until completion.
   (D) Departure from Bey Port is possible any time after completion of operations, but subject to permit of departure from the Harbour Authority.

SOUR (Tyr): 33.16 N. 35.12 E. (See Late Plans)

SHIPMASTER'S REPORT: November 1994.

LOCATION: About 12 miles North of the border with Israel.
DOCUMENTS:
1 copy Cargo Manifest.
3 copies Crew List.
1 copy Crew Personal Effects Declaration.
1 copy Stores List.
APPROACHES: B.A. Chart No. 2903.

When 12 miles from the port, vessel is required to call "Oscar Sierra" (Coast Guard Station) on VHF Channel 11 and "Israeli Navy" (Israeli Coast Guard) on VHF Channels 16 and 11. At the distance of 6 miles, vessel should call "Israeli Navy" again for permission to proceed to the port.

Permission may be granted, or they may direct the vessel to the point of 3 miles West of Sour port to wait final permission to enter the port. All data about the ship, cargo and Crew List (spelling) are requested.
PILOTAGE: Compulsory. Pilot is called on VHF Channel 16 and arrives onboard 3-4 cables North of breakwater.
ANCHORAGE: There is a convenient and well sheltered anchorage from Southerly winds and open for Northerly and Westerly winds, 6-7 cables N.N.E. from the breakwater.
RESTRICTIONS: No night navigation.
MAX. SIZE: Maximum draft should be not more than 5.30 m. in good weather conditions.
TUGS: There are no tugs available in the port. Vessels can dock or undock without tugs when weather conditions are favourable.
BERTHING: See "Plan".

Malaysia

KEMAMAN: (Also see Page 1288) (See Late Plans)

SHIPMASTER'S REPORT: November 1994.

Editor's Note: Master has called port Tanjung Sulung.

Charts: B.A. Charts No. 770 and 1374.

Approach: Tanjung Sulung is part of Tanjung Berhala, on the East coast of Malaysia, which comes under the jurisdiction of Kemaman Port, named after the local river.

The coast line is generally flat with low hills. The white LPG tanks of Tanjung Sulung, just South of the berth, are prominent.

Kuantan port, 17 miles to the South, is radar conspicuous. Tg. Gelang Lt. (LL 2857) close by is also conspicuous.

The Steel Mill on the North side of Tanjung Berhala is conspicuous, with a red flashing light in approximate position Lat. 04° 15.6′ N., Long. 103° 28.3′ E.

Anchorage: Tanker anchorage as indicated on B.A. Chart No. 1374. On our visit, we were the only ship in the anchorage and we were instructed to anchor in the Northern corner.

Tanjung Berhala Fairway Buoy is as charted.

The anchorage is very open to swells generated by typhoons to the North, although the immediate area is not in a T.R.S. path zone. There are lots of fishing nets/pots and stakes in the area. So approaching the area at night could be somewhat hazardous.

VHF: Call Kemaman Port Control on Channel 16, working on Channel 11, throughout 24 hours.

Pilot: The bulk section of Tanjung Berhala port has 24 hour pilotage. LPG ships generally only daylight berthings and departures, especially large vessels.

Pilot boards at channel entrance at Long. 103° 30′ E., not at Tanjung Berhala Fairway Buoy, from a red hulled cutter, and departs in same area. Pilot was competent and spoke good English.

Tugs: 2 tugs based at Berhala (1×2,000 h.p. and 1×3,200 h.p.). An additional tug of 3,200 h.p. comes from Kuantan, when required.

Two ship's lines required.

One tug at anchor off LPG berth whilst ship alongside.

Approach: The dredged channel depth of 15.0 m. C.D. is maintained until just inside the breakwater, then shoals to 13.0 m. C.D., basis echo trace taken both inwards and outwards. Pilots report maximum draft for LPG berth is 12.5 m. on H.W. and 12.0 m. any tidal state.

Draft for bulk carriers using the Steel Mill – East Wharf is reported by Pilots to be 14.0 m.

For all berths, vessels berth head out, swinging in the charted Turning Basin. Leading lights not operating on our visit.

Beacon No. 3 (O.G.) has been replaced by a buoy of same light character.

Berth: LPG berth is aligned 073° – 253°. GPS position agrees with berth charted position.

We found minimum depth to be 14.05 m. C.D. by hand lead line.

Berth is concrete pile construction with outlying mooring dolphins connected by catwalks, and is connected to shore by concrete pipeway/roadway of about 300 m. length.

Ships always berth port side to.

Ships' gangway used.

Moorings were 2-2-2 each end to quick-release hooks. Bow and stern lines are run by pilot boat.

Good fendering provided.

Berth completed in 1986 for Petronas Gas SDN BHD.

Density at L.W. was 1025.

Facilities: Strictly for straight run LPG Propane and Butane, both refrigerated and pressurised, to storage facility taking product from a refinery at Kerteh, some 20 miles to the North. The crude originating from fields in the South China Sea.

Four storage tanks available (2×C3 Propane at 30,000 cu.m. each and 2×C4 Butane at 25,000 cu.m. each).

Loading is by 4×12 in. 150 ASA hard arms, which can be interchanged between vapour and liquid, Propane or Butane.

1×3 in. 300 ASA line available for pressurised product.

Loading: In the past, it has been reported that initial product intake, especially Propane, has been warm. We loaded all at fully refrigerated temperature (C3) −42°C. Lines being recirculated.

Loading was started at 200 t.p.h., then increased to vessel's maximum. When the pressure in ship's tanks reaches 120 mbs., vapour return is opened, and vapour is returned to shore compressors for reliquifaction, free of charge.

Maximum loading rate is 1,000 t.p.h.

Bill of Lading is basis ship's tanks figures in vacuum. Various surveying companies available.

Propane density is 0.5083/15°C (−42°C).

Before loading, the vessel is subject to a comprehensive safety check, particularly if this is her first visit to the port. Normally this is carried out at the anchorage, but in our case, due to heavy swells, was carried out alongside after berthing. The check follows U.S.C.G. Gas Carrier Pre-Entry checks. Copies of all statutory and Line/Valve Pressure Testing Certificates are required.

The Loading Master is in contact by UHF radio. A set is loaned to vessel, as are all jetty staff.

Basically an efficient and helpful operation.

Stores: Not possible to get alongside vessel, so have to use hand trolley from area near administration building.

It is not advisable to take large quantities of stores, unless absolutely necessary.

Midship derrick will just plumb gangway landing area.

It is necessary to obtain Customs permission for bond supply, which can take 7 days.

Competitive prices, especially for beer, are available.

Fresh Water: Not available on LPG pier. Ship has to shift to Berhala Steel Quay (East Wharf).

Medical: We obtained very prompt attention for engine room casualty evacuation. Terminal arranged ambulance onto loading platform and evacuation to hospital.

Airport: Local airport at Kuantan, with flights to Kuala Lumpur International Airport.

Formalities: Easy going, but plenty of paperwork. Customs boarded latter and sealed bond.

The following documents were required:

1 copy of all statutory Certificates.
1 copy Last Port Clearance.
5 copies Crew List.
3 copies Stores/Bond List.
3 copies Personal Effects List.
5 copies Passenger List ("Nil").
5 copies Ports of Call List.
3 copies Arms and Ammunition List ("Nil").
1 copy Vaccination List.
1 copy Health Declaration.
1 copy Dangerous Drugs List.
6 copies Cargo Manifest in Transit/Discharge.
4 copies Vessel's Information Sheet.

No Seamen's Landing Cards provided. Seamen must take their Seaman's Books ashore as identification.

Immigration/Customs board before departure, and check that all seamen are on board.

KUANTAN: (Also see Page 1295) (See Late Plans)

MAX. SIZE: *Delete and substitute:*

Berth	*Length* (m.)	*Draft* (m.)	*Displacement* (tonnes)
Container/Ro-Ro	200	11.2	45,000
Multi-purpose	525	11.2	45,000
Palm Oil Berth (Outer)	250	11.5	54,000
Palm Oil Berth (Inner)	150	8.0	8,000
Mineral Oil Berth	150	8.0	8,000
Service Jetty	140	4.0	6,000
Berth 1A	70	8.0	8,000
MTBE Terminal *	240	11.4	53,000

* The Methyl Tertiary Butyl Ether Terminal of 240 m. length is under construction and scheduled to be completed by early 1995. It is a dedicated berth owned and used by the national petroleum company, Petronas.

DEVELOPMENTS: *Delete and substitute:*

Construction of the Liquid Chemical Berth (See "Max. Size"), expansion of the container yard and the purchase of a multi-purpose crane are underway.

AUTHORITY: *Delete and substitute:*

Kuantan Port Authority, Tanjung Gelang, P.O.Box 161, 25720 Kuantan, Malaysia. *Tel:* (09) 433201 (10 lines). *Telex:* Plara Ma 50234. *FAX:* (09) 433866. *Contact:* Tuan Haji Mohamed Awang Tera, General Manager. Tuan Haji Abdul Rauf Noh, Deputy General Manager. Wong Soon Fah, Traffic & Commercial Manager. Khairul Anuar Abdul Rahman, Corporate Services Manager. Malta

MARSAXLOKK: (Also see Page 1323) (See Late Plans)

The following information was received from the Port Authority on 30th November 1994.

DEVELOPMENTS: Terminal One was completed in 1993 and is now capable of handling an annual throughput of 560,000 TEU's. Malta Freeport has embarked on its most ambitious project to date, namely the development of the second Terminal: Terminal Two.

Construction of Terminal Two commenced in November 1994 and completion will occur in 1998. Once completed, Terminal Two will double the annual handling capacity to 1,000,000 TEU's.

The first phase of the oil terminal was completed in 1992, enabling a capacity of 175,000 cu.m. The second phase (185,000 cu.m.) became operational in September 1994, increasing the total capacity of the terminal to 360,000 cu.m.

Terminal One:

Name of Owner:	Malta Freeport Corporation Ltd.
Name of Operator:	Freeport Terminal Malta Ltd.
Name of Berth(s):	North Quay, West Quay.
Type of Operation:	Container Transhipment Hub.
Quay Length:	North Quay: 999 m.; West Quay: 168 m.
Depth alongside:	North Quay: 13.75 m. – 14.5 m. West Quay: 9.5 m.
Container Slots:	4,443.
Terminal Space:	223,200.5 sq.m.
Stacking Area:	76,719.5 sq.m.
CFS Area on Dock:	6,250 sq.m.
Max. Handling Capacity:	560,000 TEU.

Specification for Gantry Container Cranes:

Manufacturer	Capacity (tonnes)	Outreach (m.)	Rail Gauge (m.)	Manufactured (Year)	Hoist Type (Single/Dual)
7×MGM	40.5	42.5	18	1990/93/94	Single
1×Paceco	30.5	33.5	18	1967	Single
1×Demag	30	35.0	18	1957/58	Single
1×Liebherr	47	11-18	N/A	1992	Single
1×Liebherr	104	11-18	N/A	1992	Single

Yard Cranes:

Manufacturer	Capacity (tonnes)	Stacking Height	Type
1×Peiner	40.5	13 across 1 over 4	Rail mounted
2×MGM	40.5	13 across 1 over 4	Rail mounted
3×Paceco	35	6 across 1 over 3	Rubber-tyred
9×Ansaldo	40.5	6 across 1 over 4	Rubber-tyred

Forklifts:

Manufacturer	Capacity (tonnes)
3×Kalmar	42
1×Kalmar	35
2×Kalmar	16
4×Lansing	35
4×Lansing	5
4×Lansing	2.5

Trailers:

Manufacturer	Quantity
Sisu	58×skeletal (40 ft.)
Buiscar	14×skeletal (40 ft.)
Malta Ship Building	22×skeletal (40 ft.)
Buiscar	6×roll trailers (40 ft.)
Mafi	2×roll trailers (20 ft.)
Others	6 conventional (40 ft.)

Tractor Units:

Manufacturer	Quantity
Terberg	22
Sisu	32

Oil Terminal Jetty:
Length: 750 m. Depth: 14.0 m. – 16.5 m.

Terminal Two: Under development.

	Length (m.)	Depth (m.)
Norht Quay	480	14.5
South Quay	660	14.5
Ro-Ro Berth	220	14.5
West Quay	118	14.5
Container slots	3,846	

Proposed Equipment:
3 Quayside cranes on the North Quay.
5 Quayside cranes on the South Quay.
Yard Cranes:
18 Rubber-tyred yard gantry cranes (6 across 1 over 4).
38 Tractors.

AUTHORITY: Malta Freeport Corporation Ltd., Freeport Centre, Kalafrana BBG 05, Malta. *Tel:* (356) 650200. *FAX:* (356) 684814.

Morocco

MOHAMMEDIA: (Also see Page 1369)

(See Late Plans)

The following information was received from the Port Authority in November 1994.

ARRIVAL: *Pre-Arrival Information:* Check List to be answered and sent to the Harbour Master through the local Agent.

PILOTAGE: For tankers for the new terminal, Pilots board the vessel at the Fairway Buoy, 2 miles North of the breakwater.

ANCHORAGE: Contact Mohammedia Pilot or Mohammedia Port Control on VHF Channels 11 and 16, with view to fixing the anchorage position. Anchorage usually used for tankers is N.N.W. of breakwater at a minimum distance of 3 miles.

During bad weather, it is necessary to drift at least 10 miles off the harbour.

RESTRICTIONS: Berthing daytime only, and all vessels can leave day and night without any restrictions.

TUGS: Tugs are necessary for berthing and unberthing as per Port Authority instructions. Tugs are available day and night. "Assalama" (1 & 2) 2×6,000 h.p. "Brahim" 1×2,400 h.p. "Sidi Ismail" 1×2,400 h.p. "Jalil" 1×360 h.p. "Yacoub" 1×2,200 h.p.

TANKERS: Vessels must be in good state of repair and all equipment properly functioning prior to proceeding to the berth.

Berth A (New terminal): LOA 180 m. – 260 m. Max. draft 16.0 m.
Berth B (New terminal): LOA 190 m. – 290 m. Max. draft 17.0 m.

Vessels may be berthed in daytime only, but can sail at night. Mooring is effected with 22 nylon ropes (10 head/stern lines, 4 breast lines and 8 spring lines). Wires may also be used, but must have nylon tails. Length of each wire 200 m. and cannot be run to same fair leads as the ropes. Also make ready at least 6 spare ropes.

Moorings should be inspected and renewed as necessary during commercial operations or during adverse weather conditions. They remain the responsibility of ship's Master throughout.

All vessels nominated for operations at the terminal must be subscribing members of TOVALOP (Tanker Owners Voluntary Agreement concerning Liability for Oil Pollution) or equivalent.

The port is fitted with anti-pollution equipment, positioned as recommended, and ready for operation.

All tankers must always have sufficient crew on board to be able, in case of emergency, to disconnect hoses, loading arms, and sail immediately without delay, if ordered to do so by the Harbour Master.

Ships with an abnormal trim or list, damage to the hull, windlasses, winches, cargo pumps, machinery, radio, radar, etc., must advise the Harbour Master's Office before entering the port.

Loading/Discharging/Transfer Systems:

Berth A:

Products	Loading Arms †	Pressures (Bar)	Temperatures (°C)	Rate cu.m./hrs.
Crude Oil	3×12 in.	12 – 17	15° – 30°	5,000 – 8,600
Fuel Oil	1×12 in.	12 – 17		600
Naphtha	1× 8 in.	12 – 15	15° – 20°	1,000
Jet	2×10 in.			1,000 – 2,000
Ballast	1× 8 in.	10 – 12		700
(*)	1×8 in flexible			

(*) The flexible is for discharging ballast or loading Naphtha.
(†) All arms are 150 ASA.

Berth B:

Products	Loading Arms ††	Pressures (Bar)	Temperatures (°C)	Rate cu.m./hrs.
Crude Oil	3×16 in.	12 – 17	30° – 60°	1,000 – 6,000
LPG	2×10 in.	30 – 33	40° – 60°	1,000 – 2,000
(*)	1×12 in. flexible			

(*) The flexible is for discharging Crude Oil.
(††) All arms are 150 ASA, except LPG which is 300 ASA.
Note: For any other flange size, reducers must be furnished and installed by the vessel.

HOLIDAYS: 1st January, 11th January, 3rd March, 1st May, 23rd May, 9th July, 14th August, 20th August, 6th November, 18th November, and any other religious holidays which are not at regular dates.

CURRENCY: U.S.$ 1.00 = 9.50 Dirhams (November 1994).

WEATHER: Weather station located in Harbour Master's Office.

Nigeria

BRASS TERMINAL: (Also see Page 1458)

(See Late Plans)

The sections under the headings below should be replaced with the following:

LOCATION: Brass Terminal is an open mooring located 13.5 miles off the South Nigerian coast at: Lat. 4° 04′ N., Long. 6° 17′ 10″ E.

Chart of the area is BA 1863.

DOCUMENTS: To be submitted on arrival:

Maritime Declaration of Health
3 copies Vaccination List
6 copies Arrival Crew List
6 copies port of call list —for the past 6 weeks or 3 previous ports with dates of Arrivals/Departures)
6 copies Passenger List
4 copies Animal or Livestock List
6 copies Arms and Ammunitions List
4 copies Stores List
4 copies Crew Declaration List signed by all crew members
Customs Clearance for last Port of Call.

The Naval Office in charge of the task force on crude oil liftings at Brass Terminal has advised that all tankers calling at Brass from other Nigerian Ports must obtain, in addition to the normal Customs Clearance, a Health Clearance Certificate from the first Port of Call.

RESTRICTIONS: Berthing during daylight hours only.

RADIO: VHF radio telephone Channel 16 (156.8 MHz) is in use 24 hours a day as a stand-by Channel. Channel 14 will be used as working channel by the Marine Office/Berthing Master acting as Loading Master during Mooring/Loading operations. They are provided with walkie talkie radios to ensure adequate ship/shore communications.

Cablegrammes: Cables to Brass Terminal may be sent to LAGOS RADIO and addressed to AGIPOIL LAGOS and "GAC LOS NG".

Acceptance Procedures: The following vessels are not permitted to enter Nigerian territorial waters:

(a) Any vessel which is owned directly or through subsidiaries or chartered or managed by companies or persons in Israel, or is registered in Israel.

(b) Any vessel which has called at a port in South Africa or Israel during a period of 6 weeks immediately proceeding her arrival off any of the Nigerian Terminals (a port call includes the calling off or near a port for the purpose of receiving services from the shore by helicopter or launch boat).

(c) Any vessel which has as officers, crew, passengers or supernumeries who are nationals or residents of Israel.

All vessels must give the Company at least 5 days' notice of arrival at Brass; this ETA to be updated 72, 48 and 24 hours prior to arrival by cablegramme sent via Lagos Radio and addressed to: AGIPOIL LAGOS and "GAC LOS NG".

The messages should specify cargo requirement, ANSI diameter of flanges used for loading connections, safe working load of port derrick, advise whether a Smit's towing bracket is available, last port of call and final (discharging) port, sickness on board if any.

Vessels should contact the Brass Marine Office by VHF as soon as possible.

Upon arrival of vessel off the Terminal, Government Authorities shall check to ensure that the above mentioned provisions, set in points (a), (b) and (c), have been adhered to. Any infringement of said provisions may have serious consequences for the Master, Owner or Charterer of the vessel.

Shipping Agents: Agents with offices in Brass are Gulf Agency and Elder Dempster. Gulf Agency office is situated within the Terminal and acts upon its behalf. Both have VHF capacity.

LOADING: The line boat will tow the end of the floating hoses to the point below the tanker's port cargo manifold. The safe working load of the tanker's port derrick should be at least 7 tons.

Loading Operations can commence only after the Loading Permit is issued by the Custom Authorities and NNPC Inspectorate.

Ships are requested to load cargo as rapidly as possible by day and night in accordance with the terms of their Charter Party.

Ships are expected and nominations of vessels are accepted by NAOC on the understanding that ships will be able to accept a bulk loading rate per hour of not less than 10% of the Summer d.w.t. of the vessel or at the optimum terminal loading rate, whichever is lower.

It is extremely dangerous to close ship's valves against the oil stream as such operation may create excessive pressure in terminal piping and hoses.

Should damage result from failure to observe this precaution the Master of the vessel will be held responsible.

During the loading operations the following signals shall be displayed: International Code Flag "B" during daylight. By night a red light, visible all round the horizon at a distance of at least 2 miles.

Brass Blend crude oil loading temperature is reasonably constant as well as API gravity at approximately:

Brass Blend 85°F 43.00 API R.V.P. 10.00 (approx.)

The approximate loading rate is 5,000 t.p.h.

Also see "General" before first port.

POLLUTION: Pollution of rivers and beaches by oil is a serious matter. The Mooring Master shall inspect tanker's ballast so that there will be no chance of even a small amount of pollution when the ballast is pumped out, thereby lessening any possibility of infringement of the pollution restrictions envisaged by Nigerian law.

Pollution of the sea by dirty ballast, bilge discharge or any other means will result in heavy fines or in severe cases, imprisonment.

Port Authority Inspector will board prior to loading and remains on board throughout loading.

GARBAGE DISPOSAL: Not available.

WASTE OIL DISPOSAL: Not available.

CURRENCY: Naira. U.S.$ 1.00 = 22.00 Naira (19th October 1994).

AUTHORITY: *Operator:* Nigerian AGIP Oil Co. Ltd. Head Office, P.O.Box 1268, Lagos, Nigeria. *Tel:* 600880/9 (10 lines) *Cables:* Agipoil – Lagos. *Telex:* 21268. *Contact:* Captain F. Astarita, Marine Superintendent.

District: New Base, Mile 4 – Port Harcourt, P.O.Box 923. *Tel:* 300400/20 (21 lines). *Cables:* Agipoil – Port Harcourt.

Base: Enerhen Road, P.O.Box 334, Warri. *Tel:* 231403. *Cables:* Agip Oil – Warri.

ESCRAVOS: (Also see Page 1461)

The sections under the headings below should be replaced with the following:

RADIO: Vessels bound for Escravos must advise their ETA to Chevron, Lagos, 72 hours and 24 hours before arrival – the message to contain the vessel's name, ETA, Master's name. A 24 hour watch is maintained on VHF Channel 10, and ships are usually able to make contact on this Channel at a distance of 20 miles to 40 miles on the seaward side of the Berth Operations Platform. Channels 10 and 10A used for internal traffic and ship berthing operations. Also see "Anchorage".

Incoming vessels may be advised by the Mooring Master to keep outside Nigerian territorial waters where no official nomination or clearance has yet been received by the terminal. In such cases, the vessel is required to monitor continuously VHF Channel 10 and await permission to proceed to the anchorage.

MOORING: Before arrival at the pilot boarding area, it will be necessary to ensure that the following moorings are ready for use on arrival at the berths:

Forward: 2 mooring ropes on forecastle – buoyant lines if possible, e.g. polypropylene, on the forecastle head.

When the vessel is within reasonable distance of the buoy, 1 ship's line will be carried by the mooring launch to the floating buoy lines and secured to same, this line will then be heaved aboard. As the buoy rope comes clear of the water it will be noted that a chain is attached to it. This chain is to be secured to a bow stopper. The chain is to be secured in such a manner that the mooring rope is outside of the extreme length of the vessel; i.e. so that the chain will absorb any chafing if the buoy line crosses the bow.

Because of the mooring chain weight, incoming vessels are requested to particularly check the efficiency of their bow winches.

Power must be available at all times on deck winches and windlass while vessel is at the berth.

Aft: A tug is made fast at the stern at all times, using the tug's wire. The vessel should have a messenger rope ready for connection.

There are no special arrangements for unmooring.

HOSES: Lifting, connecting, disconnecting, lowering and other handling of hoses will be performed by the ship's crew, as advised by the Company representative, and the Company will provide a pipeline gang to assist the ship's crew. At all times a deck officer must be in attendance.

Port derrick must be rigged and ready for use on arrival and vessels are cautioned that the weight of each hose is at least 7 tons under favourable conditions. In any case, members of the ship's crew will be required to operate the winch or winches.

Particular care should be taken during the hose handling operations in order to avoid serious damage to the hoses, on the plate edges, rails, etc. The cargo hoses are fitted with fully bolted flanges and blank flanges. As no equipment will be supplied from the shore; it is essential that all vessels nominated for this port have an adequate supply of gaskets, nuts, bolts, spanners, tools, etc., in the standard sizes. Failure to have these items will lead to delay in berthing and could even lead to a situation where the vessel may no longer be accepted by the terminal. Such delays would be for the ship's account.

Before hose handling operations begin, materials must be near the manifold and remain near the manifold to cope with any escape of oil, i.e. drip trays, sand, detergent, etc., and must in the event of a spill be utilised as rapidly as possible.

Berth No. 2: Loading is through an SBM which is approx. 40 ft. in diameter and held in position by 4 chains secured to piles sunk into the seabed. 1×24 in. floating hose is secured to buoy and has 2×16 in. tail pieces attached to it.

Berth No. 3: Same as No. 2 but improved type and more heavily moored with 8 chains secured to piles sunk into the seabed. There is 1×24 in. floating hose with 2×16 in. tail pieces.

There are 2 SBM Berths only at this terminal – the conventional berth (No. 1) has been de-commissioned. The max. loading rate is 30,000 b.p.h. (approximately 4,000 t.p.h.).

LOADING/BALLAST: All vessels must arrive with only clean or segregated ballast as there is no ballast reception facilities.

"Load on top" is accepted, and vessels are requested to arrive with the slops settled. A minimum 30% Summer d.w.t. is to be maintained by all vessels, while manoeuvering or moored at the terminal, either by simultaneous deballasting and loading, or by loading part cargo first, stopping the operation for deballasting and completing cargo.

The Nigerian Government has very strong views on pollution and vessels are warned that a very careful watch is kept at all times to ensure that pollution does not take place, or that if pollution should occur it is controlled as quickly as possible.

An Oil Pollution Monitoring Inspector is assigned to each vessel on behalf of Nigerian Ports PLC.

The vessel must maintain sufficient forward draft to ensure that the cargo hose cannot become trapped under the forefoot.

During the hours of darkness it is requested that searchlights from bridge wings and approved floodlights be used to illuminate the surrounding water to facilitate detection of oil and assist generally in loading operations. Vessels are advised that failure to supply sufficient lighting could result in cargo operations not being allowed during the hours of darkness. Such delay would be for the ship's accounts.

After the ballast tanks have been inspected and found to be satisfactory, deballasting will commence on the advice of the Cargo Surveyor. When all the ballast has been discharged, the tanks will again be inspected. In any case, cargo will be loaded when both ship and shore are ready to commence operations. In no circumstances will the vessel be expected to load at a faster rate than that requested by the Master. It is the ship's responsibility to check that the requested loading rate is not being exceeded. The Company for their part will make every effort to maintain the requested rate and will advise of any alteration of loading rate immediately; prior warning being given if circumstances permit.

Throughout the deballasting and cargo operations, a deck officer must be on deck with sufficient crew members to safely handle the operation. Company representatives will be on board throughout to co-ordinate terminal and marine operations and will be in constant communication with the terminal by portable and/or ship's VHF sets. Before loading commences the amount of cargo required must be given to the Company Representative in writing and the Terminal will, in conjunction with the vessel, arrange to stop the flow of cargo at this predetermined figure. *THERE ARE NO FACILITIES AVAILABLE TO DISCHARGE EXCESS CARGO SHOULD THE VESSEL OVERLOAD.*

When requesting the tonnage required in writing, a statement should be included, and will be deemed to include, that Chevron Nigeria Limited will not be held responsible for any errors or any costs or claims arising directly or indirectly from such errors. Such statement is a condition of loading. It is recommended that frequent checks are made on the loading speed and the quantities received and required so that, if possible, adjustments can be made.

The Company Representative will advise on the detailed procedure for shutting down and disconnecting, but briefly, after cargo is completed and oil has ceased to flow, loading valves on the shore and Berth Operation Platform (BOP) will be closed. Then and not before, the vessel's manifold valves may be closed.

Do not close ship's valves against incoming oil as such procedure creates excessive pressure which may damage hoses, terminal facilities, or ship's piping. Vessels will be held liable for damages resulting from failure to observe this precaution. In addition to the above, serious pollution could result which will involve the vessel in further claims and/or fines. Therefore, for the sake and safety of all parties concerned, please use the utmost care and vigilance when loading at this terminal.

Figures taken after completion will be passed to the shore by VHF and a ship/shore difference obtained. Full sets of cargo papers will be prepared and delivered to the Master as speedily as possible. However the briefer form of documentation can be used, but only with Master's acceptance, the remainder of the documents will be forwarded by airmail. At the same time the Company will arrange clearance for the vessel. Loading signal to be displayed is the International Code flag "B" from a conspicuous halyard during the hours of daylight. During the hours of darkness a red light visible all around the horizon at a distance of at least one mile is to be exhibited.

GENERAL: In view of the exposed location of the berths, the Mooring Master, 2 surveyors and pipeline gang will have to remain on board throughout the vessel's stay at the berth and, therefore, it will be necessary for the vessel to arrange food and accommodation for this period. A pipeline gang will usually consist of 3 men, but this number may be varied at the discretion of the Company.

It is assumed that the Mooring Master will be accommodated in the Pilot Room; but where such a room does not exist on board, then accommodation equivalent to a minimum standard required for a Senior Officer is to be provided. In the case of meals, due allowance and provision is to be made for the fact that irregular hours of work by day and night may be involved.

OPERATOR: The Senior Mooring Master – Escravos, c/o Chevron Nigeria Limited, Kilometre 19, Lagos – Epe Expressway, Lekki. Postal address: P.M.B. 12825, Lagos, Nigeria. *Tel:* 2600600, Ext. 3370. *Telex:* 21314. *Cables:* Cogon, Lagos. *FAX:* 2600600, Ext. 4725.

Pakistan

KARACHI: (Also see Page 1525)

SHIPMASTER'S REPORT: October 1994.

Anchorage: Outer anchorage is large and open, and vessel can safely anchor anywhere from S.E. of Fairway Buoy to N.W. of Fairway Buoy. However, care is required in respect of number of wrecks at Outer Roads, some of which are marked by buoys. During bad weather, there is a very good chance of buoys being out of position and thus not marking the wrecks truely. Area around approach channel is marked "Anchoring Prohibited". However, a number of ships can be seen anchored within this prohibited area and even Port Control/Pilots do not seem to mind this contravention of port regulations.

During S.W. monsoons, anchoring is not recommended by Port Control, Sailing Directions or the "Guide". During S.W. monsoons, S.W.'ly swell off Karachi can increase up to 6.0 m. and vessel can expect heavy rolling while at anchor. If riding the swell, cable at regular intervals stretches to very long stay and takes excessive weight. For this reason, obviously, a good scope of cable must be paid out to avoid rapid shocks/jerks to cable, and needless to say that windlass brake and cable stopper should be in efficient condition.

Our vessel safely rode through the S.W.'ly monsoon at anchorage for 10 days. Apart from our vessel, there were about 25 other ships safely anchored, and no information was heard about any ship dragging her anchor. Also no ships were seen steaming up and down awaiting berthing, in spite of Port Control reminding the arriving ships that anchoring is not recommended.

During monsoon, prolonged anchorage can be expected as, due to heavy rains and wind, City Roads are flooded and transport system is disrupted and there are frequent power breakdowns. These factors slow down cargo handling and even oil movements through pipelines from port are greatly restricted.

Arrival Formalities/Inward Clearance: For Inward Clearance, following documents should be faxed to Agent in advance or sent by courier from last port to avoid delay after berthing:

(A) Form MMD I: Date of issue, expiry, place of all statutory Certificates.
(B) Form MMD II: Details of Certificates of Competency of all Officers and Certificates of Crew and details of Pyrotechnics.
(C) Safe Manning Certificate.
(D) Crew List.
(E) Ship's Particulars and Arrival Information.

Health message is to be sent to Port Health Officer via Agent.

Agents do not reply to any messages as there is no facility to send telexes to ships (Inmarsat) from Pakistan. If anything is urgent or important, Agent will send telexes to Owners or Charterers, which in turn is relayed to vessel. Agents can however contact ship via Karachi Radio.

Berthing/Unberthing/Pilotage: Pilot boards off Fairway Buoy. Two tugs are used for berthing. Vessel berthed at "OP4". Tugs used were underpowered and one of them broke down at a critical time. Because of low-powered tugs and awkward shape of jetty, putting vessel alongside took a very long time. Port anchor usually dropped a short distance off jetty, when berthing starboard side alongside, to facilitate pulling vessel off when unberthing. Pilot disembarks inside the harbour of Buoy "S9". The channel is about 1.5 cable wide and well marked, except during monsoons, when some buoys are invariably adrift/out of position. Very often, the buoys which have been adrift, and subsequently recovered, are temporarily positioned close to the channel (not in their original position). Information regarding missing or additional buoys should be obtained from Pilot before he disembarks, to avoid confusion while transiting channel outbound. While departing and turning in channel, off breakwater, care should be taken in respect of large number of country craft/fishing vessels which obstruct the channel while moving in and out of harbour.

Berthing of tankers and other large ships is done during daytime only. Unberthing at any time.

Terminal Facility: Crude oil and all products are handled at OP4. Max. rate at which vessel can discharge at OP4 is 1,800 tonnes/hr. for products. OP4 is equipped with Chicksans, and 10 in. connections are provided for products. Ship's radio is given to Terminal for ship/shore communication.

Bunkers are available by pipeline and barge.

Due to design and disposition of jetty, most ships cannot position their gangway on jetty. Offshore side gangway is lowered and access to and from ship is by a boat which shuttles between jetty and ship's gangway, as and when required.

General: Friday is a holiday.

Watchmen are compulsory.

Being a naval port, photography is strictly prohibited.

Port regulations state that giving liquor to any local official is prohibited.

Details of signing-off crew must be sent to Agents well in advance. Similarly, flight schedule of joining crew (Indians) has to be sent in advance, so that Agent can take permission from Customs/Immigration. Police escort is attached to Indian crew signing-off or joining.

Making contact with Manora Control by Aldis (as mentioned in "Guide" and Sailing Directions) does not seem to be valid any more, and VHF serves the purpose.

Agents advised that due to political unrest in the country, going ashore is not safe, as shoot-outs in the city are common.

Against general belief, Indians are not restricted from going ashore. On the contrary, Officials were extremely friendly.

CONSTANTZA: (Also see Page 1667) **(See Late Plans)**

The sections under the headings below should be replaced with the following:

ANCHORAGE: The roadstead of Constantza is limited by the following co-ordinates:

(A)	Lat. 44° 10′ 50″ N.,	Long. 28° 44′ 00″ E.
(B)	Lat. 44° 10′ 50″ N.,	Long. 28° 49′ 50″ E.
(C)	Lat. 44° 06′ 50″ N.,	Long. 28° 49′ 50″ E.
(D)	Lat. 44° 06′ 50″ N.,	Long. 28° 44′ 00″ E.

The meridians of 28° 46′ 50″ E. and 28° 48′ 20″ E. divide the anchorage into 3 zones, numbered from West to East.

Zone No. 1: Anchorage for vessels up to 40,000 g.r.t. (except tankers).
Zone No. 2: Anchorage for vessels over 40,000 g.r.t. (except tankers).
Zone No. 3: Anchorage for tankers, LPG carriers and vessels carrying dangerous cargoes.

The roadstead allows safe anchorage, with depths between 25 m. – 30 m. for 40 – 50 large ships, with the possibility to make a full swing, in case of change of wind or current direction.

In bad weather, small vessels may enter into the port waters only with the approval of the Harbour Master's Office of Constantza.

The control, surveillance and the leading of the vessels from the roadstead is done by "Port Control Constantza" by VHF Channel 67. The orders of "Port Control Constantza" are compulsory.

RESTRICTIONS: Entrance to the port during night-time is forbidden for tankers with a draft over 35 ft.

The entrance into the port of large tonnage bulk carriers is allowed in special circumstances.

MAX. SIZE: The maximum size vessel allowed is length of 330 m. (bulk carriers of 250,000 d.w.t.).

The depths up to 13.5 m. allow the berthing of large vessels, both in the docks for dry cargoes (Berths No. 66 – 68), as well as in docks for petroleum (Berths No. 75 – 76). For larger oil tankers, the port has a post at Berth No. 79, with a maximum depth of 18.0 m., a for the vessels with bulk solid cargoes, there are Berths No. 80 and No. 81 with a depth of 18.0 m.

In the Southern Port, the maximum depth at the berths for general cargoes, bulk and Ro-Ro is 14.5 m.

RADIO: Radio Constantza, call sign "YQI", working frequencies 500, 461 and 2748 kHz.

VHF: Permanent watch maintained.

Harbour Master's Office – Constantza	Channel 67
Port Control Constantza	Channel 67
Pilotage Constantza	Channel 14
Towage Constantza	Channel 11
Salvage Group	Channel 13
Radio Constantza	Channel 16

BERTHING:

Northern Port:	Length of quays	15 km.
	Number of operating berths	65
	Depth in basins	7.0 m. – 13.5 m.
Southern Port:	Length of quays	10 km.
	Number of operating berths	25
	Depth in basins	7.0 m. – 16.5 m.

The Port of Constantza has a warehousing surface of about 220 ha. (190 ha. uncovered and 30 ha. covered) for the general cargoes, dry bulk (coal, ore, coke, etc.) containers, steel products, construction materials, cars, etc., as well as tanks for edible oil, molasses (25,000 tons), silos for cement (40,000 tons), tanks for petroleum and petroleum products (1.7 million cu.m.), refrigerated warehouses (10,000 tons), silos for phosphates and apatite (30,000 tons) and silo for urea (25,000 tons).

Dock No.	*Berth* No.	*Length* (m.)	*No. of Berths*	*Use*
1	1 – 5	656	5	General cargoes, transshipped or stored on platforms.
	6 – 8	311	3	General cargoes, stored in warehouses.
2	11 – 12	270	2	Perishable and general goods, stored on open spaces or transshipped.
	13 – 15	366	3	General cargo, stored in the warehouses.
	17 – 18	230	2	Cereals for silo.
	19	113	1	Edible oil and molasses.
	20 – 21	250	2	General cargoes, stored in warehouses.
3	23	115	1	Timber products and construction materials.
	24	115	1	Cereals for the silo.
6	31 – 33	690	3	Cereals, meals.
	35 – 37	612	3	General cargoes, transshipped or stored in warehouses.
	38 – 39	404	2	Vehicles, equipment, spares for engine building.
7	40	208	1	Vehicles, general goods.
	41 – 43	412	3	General cargoes, transshipped or stored in warehouses.
	44	220	1	Vehicles, general goods.
	45 – 46	455	2	Metal products.
	47 – 48	455	2	Construction materials, cement and timber products.
8	49 – 51	690	3	Construction materials, cement and timber products.
	52	240	1	Goods in containers.
	53	220	1	Perishable foodstuff.
	54 – 58	1,110	5	Packed chemicals.
9	59 – 60	460	2	Packed chemicals in transshipment.
	61	232	1	Bulk or bagged fertilisers.
	62	232	1	Bulk phosphates, apatite.
	63	220	1	Bulk fertilisers.
	64 – 67	352	4	Bulk ore, coke, coal.
	68	215	1	Bulk and bagged cement.
10	69 – 70	610	2	Liquid petroleum products.
11	72 – 73	610	2	Liquid petroleum products.
12	75 – 76	610	2	Liquid petroleum products.
1 Sud	79	405	1	Liquid petroleum products.
	80 – 84	1,395	5	Ore, coke, coal, phosphate, apatite.
	85 – 96	356	2	Ore, in ships or barges with access on Danube Black Sea Canal.
Fluvio Marit.	94 – 96	600	3	Ore, coal in barges.
	108 – 114	1,306	7	General cargoes and bulk cargoes.
12 L	115 – 118	913	4	General cargoes and bulk cargoes.
12 L	120	210	1	Ferry.
	121	212	1	Ro-Ro.
	122	214	1	Bulk cement, transshipment from barges into ships.
Old Port	Passenger	293	1	Passenger.
Old Port	Ro-Ro	454	1	Cars.

BULK CARGO FACILITIES: There are facilities for the operation of bulk cargoes (dry and liquid) in specialised terminals.

Cereals Terminal: The operational Berths are No. 17 – 18 (minimum depth 7.0 m.), Berth No. 24 (minimum depth 7.2 m.) and Berths No. 31 – 33 (depth 8.8 m. – 10.7 m.).

Cereal loading/discharging from/into vessels or barges into/from silos or railway wagons is done by 5 pneumatic elevators, 2 suction elevators and 5 quay cranes.

Coal, Coke, Ore Terminal: The operational Berths are No. 64 – 67 (minimum depth 8.4 m. – 12.2 m.), Berths No. 80 – 84 (minimum depth 10.5 m. – 18.0 m.), Berths No. 85 – 86 (minimum depth 10.5 m.) and Berths No. 94 – 96 (minimum depth 3.3 m. – 4.3 m.).

The operation of the cargoes (discharge from the vessel into warehouses, barges, railway wagons, and loading from the warehouses into barges and railway wagons) is done with 8 dischargers from the vessel of 50 tons each; 4 loaders from the barge with capacities between 1,200 – 2,000 t.p.h.; quay cranes and floating cranes.

Chemical Products Terminal: Operating berths are Berths No. 54 – 61 (minimum depth 9.2 m. – 11.0 m.) and Berth No. 62 (minimum depth 6.5 m.). Berths equipped with 2 dischargers from the vessel of 25 tons each for phosphates and apatites. Berth No. 63 (minimum depth 9.8 m.) equipped with 2 loaders from the vessel with a capacity of 200 – 250 t.p.h. for urea.

Cement Terminal: Operating berth is Berth No. 68 (minimum depth 10.6 m.). The berth is equipped with quay cranes and 2 bulk cement loaders, with a capacity of 400 tons each.

Bulk cement can be discharged/loaded at other berths by floating cranes and a floating installation for loading cement from the barge into vessels with a capacity of 250 t.p.h.

Liquid Bulk Terminal: (Edible oil and molasses): Operating berth is No. 19 (minimum depth 7.0 m.). The liquid bulk is carried by pipes to 7 tanks of 25,000 tons capacity.

SPECIALISED CARGO HANDLING FACILITIES: The container terminal for the Northern Port (See "Berthing") is equipped with 2 container cranes of 40 tons, 2 transtainers of 32 tons, auto-trucks and lateral loaders. The warehousing capacity behind the quay is 3 ha.

The Ro-Ro terminal (Berth No. 121) in the Southern Port (See "Berthing") has parking for 120 vehicles of 12 m. length on the loading side, and a similar capacity on the discharge side.

Ferry Terminal: The ferry line between Constantza and Samsun (Turkey) is not yet in operation.

TANKERS: The petroleum terminal has 7 operating berths, from which 6 berths (No. 69, 70, 72, 73, 75 and 76) have depths between 11.2 m. – 12.5 m. (length of berth 305 m. each).

Berth No. 79 (depth 18.0 m., length of berth 405 m.) for large petroleum tankers.

The berths are equipped with coupling facilities to vessels, with a diameter of 12 in. and 16 in. (installation types are Woodfield and Flexider).

The terminal is equipped with fire preventing and fighting systems and equipment for leakages (collecting vessels, anti-pollutants barriers, etc.).

Russia

NAKHODKA: (Also see Page 1680)

SHIPMASTER'S REPORT: October 1994.

(A) Documents to be prepared for arrival: (Editor's Note: Same documents required for arrival Vladivostok).
   1 copy General Declaration.
   10 copies Crew List.
   3 copies Stores List.
   3 copies Crew Personal Effects List.
   3 copies Currency List.
   1 copy Health Declaration.
   3 copies List of Port of Calls.

(B) Prior to approaching Fairway Buoy, vessel must call Port Control through VHF Channel 13. Report shall include vessel's name, max. draft, vessel's intention either to load or discharge and name of Agent. If berth not available on arrival, Port Control will advise vessel to drop anchor at Quarantine Anchorage, and there, Boarding Authorities/Agent will come on board for inspections, such as ship's Certificates, documents, Seaman's Books, Bonded Stores.

Prior to departure, Immigration Officers/Agent will board the vessel and Seaman's Books will be distributed to each crew member and will remain in their respective cabins while inspection is being undertaken, after which, if all found clear, they will issue Outward Clearance.

(C) Pilotage is compulsory for all vessels, irrespective of nationality and ownership.

(D) Anchorage depth is 13.0 m. – 28.0 m.

(E) Restrictions: Vessel can leave anytime day or night.

(F) Health: Advise Agent by radio in advance if there is any case of quarantineable illness on board. If vessel arrives from a Cholera area, then Cholera inoculation is required.

(G) Tugs: Tugs and mooring assistance available. 2 tugs used and ship's tow line used.

(H) Stevedores to be arranged by Agent.

(I) Fresh water supplied by barge only. Cost is U.S.$ 7.90/ton.

(J) Fuel available.

(K) Customs Allowances: No restrictions on tobacco and alcohol onboard.

(L) Consuls: North Korea and Japan.

(M) Wind: The most dangerous wind for staying in Nakhodka Bay is the strong Southern wind of long duration caused by typhoons.

(N) Repatriation: Can be arranged during Summer months, provided documentation is in order.

(O) Time: GMT plus 10 hours (GMT plus 11 hours in Summer).

(P) Shore Leave: Every crew member going ashore must carry their Passport. No time limit.

(Q) General: While at berth in Nakhodka, we experienced ground swell which caused the vessel to move fore and aft. 3 of our mooring ropes parted. On berth, we had 5 head/stern lines, 3 fore/aft spring lines and 2 fore and aft breast lines.

Saudi Arabia

RAS TANURA: (Also see Page 1734)
YANBU: (Also see Page 1745)

NOTICE: Issued by Saudi Aramco on 1st October 1994.
Quote:

SHIP'S STANDARD MESSAGE

Effective December 1st, 1994, Communication will apply the attached standard message to all ships calling Saudi Aramco Terminals at Ras Tanura, and Yanbu as well. Hence, we appreciate communicating this to all your customers. It is mandatory to answer back all information required, in order to eliminate any conflicts, usually caused by shortage of information received from ships.

From: Saudi Aramco Ras Tanura. No. . . . . UTC/Date and time. . .
Master . . . . .

Please contact "HZY" on CW or Inmarsat Telex 801919 Amar SJ with following information:

One ETA UTC Ras Tanura Entry Buoy, any later changes.
Two Ship's former name if any, present flag, net registered tonnage.
Three Agent's name, last dry dock MM/DD/YY and Master's name.
Four Cargo requirements in net barrels and destination of cargo.
Five Bunker requirements in net barrels fuel and/or diesel bunker.
Six Arrival/departure draft fore and aft, arrival displacement tonnage, derrick capacity, number and size of connections.
Seven If loading Arab Medium for the account of Banoco and/or Arab Extra Light, your ship must arrive with a maximum arrival draft of 54 ft. plus tide, and a maximum sailing draft of 64 ft. plus tide.
Eight If loading LPG, advise if ship's tanks sufficiently cooled for normal loading, otherwise advise if you require coolant.
Nine Whether gas-free or in inert condition.
Ten Deballasting hours, loading rate, if can load cargo concurrent with deballasting, maximum loading rate after deballasting.
Eleven Previous cargo, also quantity and quality of part cargo or residue or slops aboard, if any, and whether to be mixed with Ras Tanura cargo or not.
Twelve If loading more than one grade, which grade to be loaded first, or if can load simultaneously, and loading rate for each grade.
Thirteen Does your vessel comply with SOLAS Conventions regarding the fitting and use of a fully operational Inert Gas System.
Fourteen It is a requirement of the port that the propeller remains immersed and stern trim does not exceed 1.5% of the ship's length when at berth. Confirm that your vessel will comply.

If VHF aboard, call Ras Tanura Pilots on Channel 16 or 14 for anchoring, boarding and berthing instructions when 100 miles out. On arrival anchorage, advise "HZY" offical readiness time and anchored position. Radio messages without charge. Pilots require sufficient clean ballast for manoeuvring with propeller covered and trim limited to 15 ft. for Ras Tanura Terminal, and 8 ft. for Juaymah Terminal. Imperative all vessels operating under Early Departure Procedure, copy "HZY" traffic list after departure until cargo quantities are resolved and Agent is authorised to sign cargo documents.
Saudi Aramco.

From: Saudi Aramco Ras Tanura. No. . . .UTC/Date and time. . . .
Master . . . . .

Please advise any epidemic disease or illness on board. Status of crews International Certificates of Immunisation. All ports called past 30 days. Destination. Flag. Net registered tonnage. Vessel will not be allowed to berth until this information is received.
Saudi Aramco.
Unquote.

Somalia

BERBERA: (Also see Page 1790)

SHIPMASTER'S REPORT: August 1994.

IMPORTANT: Most seafarers are not aware of the fact that Somaliland is a separate entity, an independent State and no more a part of Somalia. The Port Authorities would rather you do not fly any courtesy flag, but certainly *not* a Somalian one. As this vessel (8,178 d.w.t. tonnes, MOGAS and gas oil, as part cargo only) was calling for the first time, the Agents were only too pleased to present the vessel with a flag.

Port Limits: As per report in "Guide to Port Entry".
Documents:
4 copies Crew List.
2 copies Crew Personal Effects Declaration.
1 copy Vaccination List.
Last Port Clearance.
Health Declaration.

All Port Officials were very courteous and promptly completed their formalities and departed.

Pilotage: Since no telecommunication was possible with Agent, all information regarding ETA, vessel's particulars, etc., was sent through the Charterers at Dubai and constantly updated all other information as per "Guide".

Anchorage: As per "Guide". Approach anchorage with extreme caution as all navigational marks unlit. The buoys were not existant. Vessels at anchor, even though manned, were not exhibiting any lights. In the months from June to September (South West Monsoons), wind picks-up from a S.W.'ly direction from about 2100 hrs. in the evening until about 1100 hrs. the following morning.

Max. Size: Up to about 40,000 d.w.t. and 28 ft. draft.

Health: Usual Health Declaration form completed on arrival.

Radio: No working radio station.

VHF: Channel 16 watch maintained. Operator responded promptly. Usual information is requested many times.

Radar: No service available.

Tugs: No tugs available. All berthing undertaken without assistance. Two mooring boats assist in running lines to the buoys. One boat is a wooden boat and the other is an enclosed lifeboat, which is also used for Pilot boarding and disembarking.

Berthing: Berthing is restricted to daylight hours only.

During monsoons, vessels berth only after wind has died down. No unberthing operations after sunset at tanker terminal. We observed small cargo vessels leaving port at about 2200 hrs.

Bulk of the cargo shipped out of this port is livestock. Some general cargo is also imported. Most vessels observed were rather small cargo vessels. All gear used was ship's gear.

A dilapitated terminal exists. None of the gear is used anymore. The vessel makes fast to 7 buoys just off the terminal. The 8th buoy, which is ideally placed to make fast the breast line on the starboard bow, has sunk with no clue as to clearance over it. Two mooring boats assist in making fast to the buoys.

The Pilot gives all orders to the boats. These boats also serve as pilot boats, routine launches, etc.

Density: 1025 – 1026.

Fresh Water: Fresh water is only available at the general cargo berths. However, only limited quantity of fresh water is available.

Fuel: No fuel available.

Consuls: None.

Repairs/Dry Docks: No facilities exist.

Surveyors: Terminal engineer acts as surveyor.

Watchmen: Two watchmen compulsory (both men slept from the time they boarded until the next evening when vessel was ready to sail, only waking up for their meals).

Customs Allowances: 200 cigarettes and 1 litre of alcohol.

Repatriation: Possible, but suggested only in cases of extreme emergency.

Airport: One airport with very limited services.

Agent: M/S Modaria served the vessel and found to be very co-operative.

General: All other information as described by other Shipmasters. Services such as telephone, banking, Seamen's Club, Waste Disposal, etc., are not available.

Spain

GIJON: (Also see Page 1830) **(See Late Plans)**

REPORT: November 1994.

Entering/Sailing Regulations:

Maximum draft permitted 54 ft.

Vessels can enter/sail at any time of the day or night according to following official conditions:

Length (m.)	*Draft* (ft.)	*Remarks*
215 – 250	45	–
250 – 260	45	Good weather conditions for manoeuvring.
260 – 275	45	Good weather conditions for manoeuvring.
275 – 290	43	Good weather conditions for manoeuvring and daylight.
290 – 305	54	Good weather conditions for manoeuvring and daylight.
Over 305	–	Owners, through their local Agent, must apply in every case for permission to Port Authority before ship's arrival.

Note: Length to be considered as between perpendiculars, except for bulbous bow vessels, in which case length overall applies.

Anchorage:
Outer: It is suggested to drop anchor 1 mile from port entrance ("Cabo Torres" bearing 090° × 1.0 miles – 1.7 miles).
Inner: Depends on ship's particulars and weather conditions, being decided always by Pilot and Master.

Tide: Maximum tidal range 4.60 m.

Shore Storage Particulars:

Operator:	Repsol Butano, S.A.	
Products handled:	Butane	Propane
Minimum Temperature:	−4°C	−2°C and −45°C
Cargo Pressure:	12/14 kg.	12/14 kg.
Pressurised/Semi-Refrigerated/ Fully Refrigerated:	Pressurised.	Semi-Refrigerated, pressurised and fully refrigerated.
Maximum Discharging Rate:	300 tons/hr.	200 tons/hr. (−2°C) 100 tons/hr. (−45°C)
Cargo Operations permitted by night:	Yes	Yes
Round the clock Discharging:	Yes	Yes
Vapour Return Line available:	Yes	Yes
Distance from Berth to Storage:	2.5 km.	2.5 km.
Hoses of 4 in./6 in. available:	Yes	Yes
Diameter of Shore Line:	8 in. Liquid 6 in. Vapour	8 in. Liquid 6 in. Vapour
Maximum Back Pressure permitted:	4/5 kg./sq.cm.	6/8 kg./sq.cm.

Storage: 10 Butane tanks – 26,490 tons (46,425 cu.m.).
11 Propane tanks – 9,859 tons (17,296 cu.m.).

Storage tanks are located 2.5 km. (approx.) from Marine Terminal and 140 m. above sea-level.

Cargo Handling Equipment:

(a) 3 Shore line connections and 2 discharging arms for liquid as per Plan (See "Late Plans").
1 Reheater from −45°C to 0°C.
2 Booster pumps 100 t.p.h. capacity each.

(b) Intermediate station 2 km. from port.
4 Booster pumps 70 t.p.h. capacity each.
Railway Gas Terminal fitted for discharging directly from vessel to tank wagons.
Daily railway tank wagons forwarding capacity 1,500 tons.

Products for LPG Carriers: Available on request: Liquid Nitrogen, Methanol, CO2, Freon, Oxygen, Acetylene.
All kinds of chemicals (Gamlen, Perolin, Ameroid, etc.).
Liquified Gases Facilities:

Name:	"Muelle de los Porticos" (Dique Norte).
Type of Berth:	Normal concrete berth with rubber fenders.
Mooring:	Normal mooring system, giving lines to bollards alongside.
Length:	146 m., but any length acceptable.
Draft:	45 ft. (always afloat).
Type of Handling Installation:	6 in. and 4 in. shore hose connections for liquid and vapour and 10 in. discharging arms available. No vessels' hoses required.
Largest LPG/Carriers Entered/Discharged:	48,920/32,794/61,340 GRT/NRT/DWT Length overall: 228.86 m. Draft: 44 ft. 4 in. 43,738/28,726/54,158 GRT/NRT/DWT Length overall: 231.12 m. Draft: 44 ft. 6 in.

Larger sizes of ships can be accommodated, but Harbour Master's authorisation must be obtained prior to vessel's arrival.
Bunkers: Diesel oil and fuel oil available.
The Spanish Bunkering Company "CAMPSA" is the only one attending such service who has contracts with the main oil companies in the world, so Owners' usual contractors can be used for arranging delivery of any quantity required.
1×800 ton barge in operation.

Thailand

SRIRACHA: (Also see Page 1926)

(A) PORT FACILITIES *(Excluding Thai Oil SBM and CBM)*.

TANKERS: *Thai Oil Sea Berth: Delete* Text. *Insert:* See Part (C).

Thai Oil Jetty: Delete and *substitute:*
Thaioil Co., Ltd. (TOC) Jetty: The following requirements apply to vessels for the use of berthing, unberthing, loading and discharging at TOC's Jetty (Location: Lat. 13° 7.3′ N., Long. 100° 53.2′ E.).

Berth No. 1 (Inner Berth):
Maximum LOA 100.5 m.
Maximum safe draft 4.8 m.
Minimum size of vessel 600 d.w.t.
Maximum size of vessel 5,000 d.w.t., consistent with LOA and draft.

Berth No. 2 (Outer Berth):
Maximum LOA 106.0 m.
Maximum safe draft 5.5 m.
Minimum size of vessel 600 d.w.t.
Maximum size of vessel 5,000 d.w.t., consistent with LOA and draft.
Vessels approaching from the South will cross the submarine crude pipeline to the CBM Berth. This line is marked by a buoy which must be passed to *seaward* to ensure adequate under-keel clearance. Engine(s) must not be used when crossing the pipeline to avoid risk of scouring seabed.

Berth No. 3:
Maximum LOA 83.0 m.
Minimum LOA 60.0 m.
Maximum safe draft 5.5 m.
Maximum size of vessel 2,500 d.w.t., consistent with LOA and draft.
Vessels in fully loaded condition *must approach the berth from the North*, in order not to cross the submarine crude oil pipeline located at the South end of jetty as marked by a buoy.
The use of anchor(s) when berthing is prohibited due to the proximity of the submarine crude oil pipeline.

Berth No. 4:
Maximum LOA 122.0 m.
Maximum safe draft 6.7 m.
Minimum size of vessel 1,000 d.w.t.
Maximum size of vessel 5,300 d.w.t., consistent with LOA and draft.

Berth No. 5:
Maximum LOA 122.0 m.
Maximum safe draft 6.4 m.
Minimum size of vessel 1,000 d.w.t.
Maximum size of vessel 5,000 d.w.t., consistent with LOA and draft.

Berth No. 6 (LPG):
Maximum LOA 122.0 m.
Maximum safe draft 5.8 m.
Minimum size of vessel 600 d.w.t.
Maximum size of vessel 5,300 d.w.t., consistent with LOA and draft.

All Berths: The following conditions apply to all berths:
A mooring boat will be in attendance to run mooring lines and provide assistance for berthing and unberthing. One additional mooring boat for Jetty No. 3.
Approach speed to the jetty for fully loaded vessels must be the minimum consistent with safe manoeuvring. The jetty has been designed for berth impact of fully laden vessels at 0.3 m./sec., and any excessive approach speed will endanger the jetty.
Vessels to have derrick S.W.L. 2 tons.
Mooring to consist of 3 ropes forward (head lines and breast) and 3 ropes aft (stern lines and breast), plus one forward and one aft back spring. Rope size to be 5 in. for vessels under 2,000 d.w.t. and 6 in. for vessels over 2,000 d.w.t.
During mooring and unmooring operations, the ship's crew to have close supervision by officers.
The safe conduct of all operations on board the vessel while at the berths must comply with ISGOTT (International Safety Guide for Oil Tankers and Terminals) recommendations, which are accepted oil industry practice.
When a vessel is loading LPG, the use of her galley fires and hotplates is prohibited.
When the vessel is loading LPG on Berth No. 2 (Outer), the use of galley fires and hotplates by vessel on Berth No. 1 (Inner) is also prohibited as her galley is less than 50 m. from the LPG manifold on the jetty.
When the vessel is loading LPG on Berth No. 1 (Inner), the use of galley fires and hotplates by vessel on Berth No. 2 (Outer) is also prohibited as her galley is less than 50 m. from the LPG manifold on the jetty.
When the vessel is loading LPG on Berth No. 6 (Inner), the use of galley fires and hotplates by vessel on Berth No. 5 (Outer) is also prohibited as her galley is less than 50 m. from the LPG manifold on the jetty.
All equipment (including mooring and unmooring equipment) to be maintained in good operational condition.
Expected discharge rates of vessels is 400 – 600 cu.m./hr. at approximately 120 p.s.i.g.
Remarks:
Should the Thaioil Marine Manager not be satisfied that any of the above requirements have been met, he has full authority to order the vessel off the berth.
Should the Thaioil Marine Manager consider that a berthing operation will endanger the jetty due to adverse weather conditions or any mechanical defect in the vessel, he has full authority to refuse to allow the vessel to berth.
When awaiting berth at anchor, the vessel should anchor in an area not to obstruct the approach route of other vessels to the berth. The jetty gang listen on Channel 13 on VHF radio on a 24 hour/day basis for marine communication.

(B) *THAI OIL – SBM.*

This entry supersedes the entry on Page 1928.

LOCATION: The SBM of Thaioil Co.Ltd. Sriracha is a Catenary Anchor Leg Mooring (CALM) and located between the island of Ko Si Chang and mainland Thailand, in position Lat. 13° 07′ 43″ N., Long. 100° 51′ 45″ E.
The water depth is approximately 23 m. (Ref. B.A.Chart No. 986 "Approaches to Ao Udom").
DOCUMENTS: *Documentation/Pratique:* Custom regulations are rather extensive. Customs Clearance will take place onboard upon arrival. No advanced Radio Pratique is permitted. All documents must be prepared and ready for submission upon arrival.
Following documents are required:
For Customs Officials:
6 copies Crew List.
6 copies Personal Belongings List.
6 copies Provision/Stores List.
6 copies Foreign Currency List (ship's and personal).
6 copies Deck/Engine Stores List.
6 copies Arms List.
6 copies Ammunition List.
6 copies Opium and Drugs List.
6 copies Bonded Stores List.
6 copies Passenger List (To be typed, even when no passenger onboard).
For Immigration:
3 copies each Inward/Outward Forms No. 3 and 4.
3 copies Crew List, Immigration Form No. 35.
All Immigration Forms will be handled by Agent on arrival.
For Port Health Authority:
2 copies Vaccination List.
1 copy Maritime Declaration of Health.
PILOTAGE: The Government Pilot and Thaioil Representatives will board the incoming vessel approximately 2 nautical miles S.W. of the SBM in the Pilot Boarding Area as indicated on B.A. Chart No. 986.
APPROACHES: *Approach to the SBM:* At the Thaioil SBM in Sriracha, tankers are berthed with the hose strings lying on the port side of the vessel. This configuration was chosen to cater for the general tendency of vessels to swing to starboard (and away from the SBM) when using the engine for astern movements during the final stages of the approach.
Special care is to be taken to prevent collision with local fishermen and/or other vessels under way or at anchor, the area between the mainland and Ko Si Chang being congested with various marine installations and activities.
The final approach is made at the slowest possible speed, keeping the vessel manoeuvrable, and the SBM slightly open on the port side, never ahead, in order to let the tanker pass clear in case of overshooting or if an emergency occurs.
Two tugs, one at each forward shoulder, assist in keeping the tanker's bow steady.
The direction of the approach is governed by wind or current, or a combined effect of both, bearing in mind the vessel's draft and handling characteristics.
Vessels with draft restrictions when passing the Ko Si Chang Bar (i.e. draft between 14.8 m. and 18.2 m.) should generally approach the SBM

from the South on an ebb tide. This will enable the vessel to always manoeuvre with sufficient water underneath her keel.

Vessels with drafts below 14.8 m. can be berthed at any stage of the tide, provided they stay in sufficiently deep water. It should be born in mind that the 14.0 m. contour of the sea bed is only 1,400 m. (7.5 cables) to the East of the SBM.

RESTRICTIONS: Berthing and unberthing is carried out at day and night. Berthing restrictions apply to vessels with a draft greater than 14.8 m., which will be berthed on ebb tide only.

All tankers stemmed to discharge at the Thaioil SBM must be equipped with bow chain stoppers and manifold equipment in accordance with OCIMF Recommendations.

Owners assurance will be sought prior to acceptance.

MAX. SIZE: The buoy is designed to accommodate tankers of sizes between 60,000 d.w.t. and 230,000 d.w.t. (part-loaded).

Tankers of a deadweight of 320,000 tonnes (part-loaded) could also be accommodated, but may also incur additional draft penalty (See "Draft Information").

Ko Si Chang Transit and Draft Information: The Ko Si Chang Bar Channel for deep draft vessels is defined by the following positions:

From:	Lat. 13° 03′ 04″ N.,	Long. 100° 48′ 47″ E.
To:	Lat. 13° 03′ 15″ N.,	Long. 100° 48′ 40″ E.
To:	Lat. 13° 03′ 40″ N.,	Long. 100° 49′ 43″ E.
To:	Lat. 13° 03′ 51″ N.,	Long. 100° 49′ 35″ E.

The maximum loaded draft over the Ko Si Chang Bar channel at any high water is 17.6 m., and calculated as follows:

Chart Datum above LLW	16.7 m.
Accuracy of Sounding	0.4 m. (minus)
Under-keel Clearance	1.5 m.
Rise in Tide	2.8 m. (minimum rise in tide any day)
Maximum draft	17.6 m.

Consequently any vessel with a draft of up to 14.8 m. can cross the bar channel at any time every day.

Although at certain periods of time, the maximum rise in tide can reach 3.9 m., the maximum draft for vessels calling at the SBM is restricted to 18.1 m. by the height of the pipeline end manifold (PLEM) above the sea bed.

Increase in draft beyond 18.1 m. for 'pumping-over-the-tide' is not permitted.

Within a radius of 950 m. around the SBM, the sea bed is dredged to a minimum water depth of 19.0 m. above LLW.

HEALTH: See "Documents".

RADIO: *Information required prior to Arrival:* Vessel's arrival draft and ETA to be given 7 days, 3 days, 2 days and 1 day prior to arrival. Vessels should attempt to arrive on even keel or as close to even keel as possible.

VHF: Initial contact with the Pilot can be made on VHF Channel 16 (Call Sign "Thaioil"). Once the contact is established, communication will be switched to Channel 13 or 73.

Communication during discharge between ship and shore is carried out by the Thaioil representative on board.

In addition, the ship is to keep a constant radio watch on Channel 13.

TUGS: Tugs are normally not required during berthing or unberthing, but are available for emergencies. 2 tugs of 2,400 b.h.p. and 2 tugs of 1,900 b.h.p. are available.

BERTHING: *Buoy Dimensions:* Diameter 12.0 m. Skirt diameter 16.2 m. Height 5.3 m. Draft 2.6 m. (approx.).

The buoy is cathodically protected by sacrificial anodes.

A white navigation light flashing "S" every 6.2 seconds with a range of 5 nautical miles is mounted to the turntable some 7.0 m. above water level.

An octahedral radar reflector with a diameter of 0.5 m. is mounted on top of a steel rope guard some 5.5 m. above water level.

Buoy Mooring: The SBM is moored with 6 chain pendants of 3.5 in. (89 mm.) stud link chain, each having a nominal length of 330 m., average angle of the chains to the horizontal being between 48° and 52°. The 6 chain pendants are anchored to the sea bed with anchors of high holding power (200 tonnes).

Mooring Arrangement: (OCIMF Standard). Tanker moorings from the buoy comprise of 2×12 in. circumference × 150 ft. (45.72 m.) long double braided circular hawsers, complete with floats and thimbles at each end.

The buoy end of the 2 mooring hawsers are attached to triangular plates and lugs on the turntable, which is mounted on a continuous roller bearing and free to turn 360°. This allows the moored tanker to lie head into the wind and/or tide.

The tanker end of the 2 mooring hawsers terminate in 2 chafing chains of high tensile steel, 8.0 m. long, grade U3, 76 mm. stud link chain with triangular plate attached to it, which is connected to a second chafing chain of high tensile steel, 3.5 m. long, grade U3, 54 mm. stud link chain with triangular plate. A 250 mm. (8 in.) circumference 20 m. long pick-up rope, which is buoyed off is attached to each set of chafing chains.

For berthing purposes, the port pick-up rope will be connected to a 150 m. (490 ft.) long 250 mm. (8 in.) circumference messenger rope (first line to pick-up), while the starboard pick-up rope will be connected to a 70 m. (230 ft.) long 250 mm. (8 in.) circumference messenger rope (second line to pick-up).

Only vessels which are equipped to the latest OCIMF Standard, having bow chain stoppers (tongue or hinged bar type) and fairleads are accepted to moor at the SBM.

Berth Preparation: Prior to the tanker's arrival, the Assistant Marine Manager and the Marine Supervisor proceed to the SBM to ensure the hose string and mooring lines are not fouled or entangled around the SBM. The outer (starboard) mooring line is towed clear round the buoy to prevent any accidental fouling of the launch's propellers when manoeuvring to pick-up the inner (port) pick-up rope.

The second SBM mooring launch makes fast at the end of the 2 floating hose strings and tows the hose strings to port, in order to clear the path for the incoming tanker. After the mooring is completed, the launch tows the hose strings back to the tanker's manifold, in order to be ready for picking-up and connecting the hoses.

In the rare case that only one SBM mooring launch is available for berthing, the hose strings will be looped back and lashed to the turntable of the SBM, in order to prevent entanglement with the tanker's propeller.

Mooring: Once the Assistant Marine Manager and the Marine Supervisor have completed the berth preparations, they board the incoming tanker, and the SBM mooring launch returns to the SBM to connect the 150 m. (490 ft.) messenger rope to the pick-up rope of the port mooring line. The SBM mooring launch runs out the full length of the messenger rope and meets the incoming tanker. The tanker lowers a mooring/messenger rope which is picked-up by the launch and shackled to the end of the messenger rope.

The tanker is now in a position to pick-up the messenger and be manoeuvred to the SBM. It is pointed out, that warping the tanker up to the buoy is to be avoided. The tanker is manoeuvred to the buoy by use of her engines and rudder and with the assistance of 2 tugs, while the messenger rope is only used to pick-up the slack of the messenger and heave up the chafing chain to the forecastle.

Once the chafe chain is in the correct position in the bow chain stopper, it is secured and the port mooring is thereby made fast.

The SBM mooring launch then returns to the SBM to pick-up the second (starboard) pick-up rope and shackle the 70 m. (230 ft.) messenger rope to it for passing to the tanker.

The second mooring rope is then secured in a similar manner.

Vessels of a deadweight below 150,000 tonnes, which have only one bow chain stopper provided on the forecastle, will secure only one chafing chain in the bow chain stopper and hang-off the second mooring line from a different fairlead, such that only the upper end of the chafing chain is in the fairlead and all weight is taken by the mooring secured in the bow chain stopper.

Unmooring: Tugs are normally not required in this operation, but this varies with the weather condition, the state of tide and the congestion with ships at anchor in the vicinity. The starboard mooring is usually released first.

The 70 m. pick-up rope of the starboard mooring is taken to a winch drum and the weight taken on the mooring rope until the bow chain stopper can be opened. The chain, the 20 m. pick-up rope and the 70 m. messenger rope are then lowered to the SBM mooring launch, where it is disconnected and the pick-up buoy attached. The mooring is towed clear by the SBM mooring launch if required, to void fouling of the second mooring, once it is released. The second mooring is similarly disconnected.

In adverse weather conditions, the same method of unmooring as described above is employed. It may be necessary to assist in taking off the weight of the mooring lines by short ahead movements with the ship's engine, but these must be used with discretion to avoid moving up to the buoy.

Once both moorings have been released, the tanker is given stern way until the bow is well clear of the end of the hose strings. The tanker then gives a good lee and the Assistant Marine Manager and Marine Supervisor disembark, the tanker can now proceed to sea.

CARGO OPERATIONS: *Pipeline and Hose:* A 40 in. pipeline of 3.8 km. length connects the SBM with the storage tanks ashore. The pipeline is concrete coated and cathodically protected by sacrificial zinc anodes. The pipeline end manifold (PLEM) is located directly underneath the SBM.

Two underwater hose strings with a length of 85 ft. (25.9 m.) and an internal diameter of 20 in. in "Chinese Lantern" configuration connect the PLEM with the under buoy flanges. The hoses are electrically discontinuous in order to isolate the cathodic protection of the sea line and the buoy, and are supported by beadfloats for better buoyancy.

Submarine hose strings (2) configuration:

1 submarine hose one end reinforced	20 in. (ID) × 30 ft. length.
1 submarine standard line	20 in. (ID) × 25 ft. length.
1 submarine hose one end reinforced	20 in. (ID) × 30 ft. length.

The two floating hose strings, the inner one with a length of 970 ft. (296.0 m.) and the outer one with a length of 1,005 ft. (306 m.), and both with an internal diameter of 20 in./16 in. respectively, connect the turntable buoy flanges with the ship's manifolds. The hoses are electrically continuous except for the tail end hoses, which isolates the cathodic protection of the SBM from the tanker. Either floating hose string can be isolated by closing the butterfly valve on the SBM turntable to allow discharging through one hose only.

In the rare case of discharging through one hose only, the other hose should be tied back and secured to the turntable in order to prevent it from fouling the ship's propeller.

Floating hose strings (2) configuration:

1 half integral floating hose with extra strengthening over the unsupported length	20 in. (ID) × 30 ft. length.
23/24 full integral floating hoses	20 in. (ID) × 35 ft. length.
1 break away coupling	20 in. × 16 in.
3 lightweight floating rail hoses	16 in. (ID) × 35 ft. length.
1 lightweight floating rail hose with extra buoyancy at both ends	16 in. (ID) × 30 ft. length.

Derrick: Refer to OCIMF Standard.

Port derrick to be rigged for hose connection.

Connecting Hoses: Hose connection is carried out by shore personnel with assistance of the ship's crew.

After the tanker is safely moored, the hose equipment consisting of rope slings, shackles, gaskets, nuts and bolts, Blake Stoppers and wire strops, are taken on board.

The hoses are lifted and connected one at a time, the inboard hose string first.

The blind flange at the end of each hose string is connected to a short lifting chain with an open link at the end. The lifting chain is supported by a PVC buoy connected to the chain by a small wire. The launch picks up the buoy and secures the open link on deck and brings the hose directly under the derrick head. The derrick runner hook is then secured to the open link and the hose is lifted out of the water until sufficient length is available for direct connection to the ship's manifold. The weight of the hose is then transferred to the snubbing chain by tightening the connecting chain which is shackled to the snubbing chain and securing it in the Blake Stopper which itself is to be secured to the ship's manifold bitts. The blank flange is removed and the hose connected to the ship's manifold. The butterfly valve at the hose end is opened and secured.

After connecting, both hoses are supported by rope slings suspended from the derrick runner hook in order to maintain a reasonable radius of bend. If necessary, the hoses are lashed on each side of the hose bar to reduce movement caused by swell.

Ship's impressed current cathodic protection, if operational, should be kept on.

Discharge of Cargo: Only one grade can be discharged at the time, dependent on shore requirements.

The quantity discharged is to be checked and compared with shore on the full hour at 2 hourly intervals. If at night the difference between ship and shore exceed 1,000 cu.m., then the cargo has to be stopped and the cause has to be investigated in order to ensure that no sub-sea leaks develop undetected.

During discharge, all floating hoses and the surrounding area should be checked frequently for oil leaks. If any oil leak is detected, the Marine Supervisor, who remains on board throughout the vessel's stay at the SBM, is to be informed without delay.

Throughout the vessel's stay at the SBM, one member of the shore crew is to be stationed on the forecastle to watch the SBM and notify the Thaioil Marine Supervisor before the vessel comes into contact with the SBM. Engines have to be ready on 10 minutes notice.

In the event that the mooring lines become fouled or the SBM hoses trapped between the SBM and the vessel, the SBM mooring launch will be utilised to clear as necessary. The launch remains on stand-by throughout.

Discharge Rate/Pressure: Maximum discharge rates that can be achieved vary between 7,200 cu.m./hr. and 8,300 cu.m./hr. respectively and are dependent on the flow characteristic of the crude oil.

The maximum discharge pressure permitted at the ship's manifold is 10 bar.

Hose Disconnection: This operation is carried out by shore personnel, with the assistance of the ship's crew.

Once cargo has been completed and shore valves are confirmed closed, the ship can close her manifolds. The butterfly valves at the end of the hoses are closed and secured and the hoses disconnected and blanked-off. The cargo runner hook is connected to the open link of the lifting chain of the outer hose and the hose lifted clear of the deck transferring the weight from the snubbing chain. The Blake Stopper is removed from the connecting chain and the hose lowered into the water. The SBM mooring launch will secure the open link of the lifting chain on her deck and disconnect the cargo runner hook. The PVC buoy is re-connected and the hose lowered into the water. The same procedure is repeated for the second (inner) hose and thereafter the hose gear is lowered into the SBM mooring launch, prior to unmooring.

If the hoses are found to lie close to the ship's propeller, they should be turned back and secured to the turntable, or pushed away by the SBM mooring launch.

Ballast: Non-SBT tankers below 120,000 deadweight tonnes may be allowed to discharge the entire cargo before taking ballast into the cargo tanks (weather permitting). All other vessels have to maintain a minimum deadweight of 30%.

Masters are advised to commence taking permanent ballast as soon as necessary, to keep the vessel at maximum draft not exceeding 17.6 m.

Crude Oil Washing (COW): Marpol 73/78 Convention requires that crude oil washing be carried out during discharging. Full crude oil washing will be subject to Terminal agreement.

COW is to be carried out in accordance with the ship's COW Operations Manual and the International Safety Guide for Oil Tankers & Terminals (ISGOTT).

I.G. Failure: In the event of a inert gas plant failure, discharge and crude oil washing must be stopped until the I.G. system is fully operational again.

MEDICAL: Doctor, dentist and hospitals are available.

FUEL: All bunkers are available by barge at anchorage only. Quantities are limited unless advanced notice is given. It is recommended to confirm bunker requirements on arrival. Failure to do so may result in cancellation or delay.

FRESH WATER: Available by barge at anchorage only. Minimum order is 200 tonnes, delivery rate approximately 30 tonnes/hr.

REPAIRS: Only minor repairs can be carried out by local workshops or by Bangkok's facilities. Advance notice is necessary since spare parts are difficult to obtain.

Immobilisation: Immobilisation of engines or steering gear is not permitted at any time while the vessel is moored to the SBM. Engines and helm must be made available at short notice (i.e. within 10 minutes).

REPATRIATION: Available via Bangkok. Advance notice on crew member's particulars is required.

SHORE LEAVE: Shore leave is permitted. No passes required. Boat service to be arranged via Agent.

GENERAL:

Berth Security and Safety: Throughout the vessel's stay at the SBM, no other craft (i.e. bunker, water, and stores barge, etc.) is permitted to moor alongside the vessel, the sole exception being the SBM mooring launch.

Accommodation Ladder: Accommodation ladder to be rigged on both sides ready for the Pilot, and later the Government Authorities, to board the vessel.

Shore Personnel: A representative of Thaioil will stay on board throughout the vessel's stay at the SBM. Adequate accommodation and messing facilities should be provided.

Additionally a 6 man shore crew, who are employed to watch the SBM from the forecastle and stand-by for emergency hose disconnection, will remain on board. The shore crew will not need to be accommodated in cabins, but will be satisfied with a room such as the gym or a table-tennis room. They will be provided with their own food, but will require water.

At times, the ship's Agent will provide 2 Marine Police who will require accommodation and messing facilities.

Stores and Provisions: Available at 48 hours notice. Fresh provisions are available in ample quantities and of good quality. Deck/engine stores are usually available in reasonable quantities, but selection is limited.

WEATHER:

Current: The main direction of the current runs more or less parallel to the shore line in a Northern direction during flood tide and in a Southern direction during ebb tide. The maximum rate of the current is around one knot.

Tide: Refer to British Admiralty Tide Tables – Bangkok Bar/Ko Si Chang.

Waves: In stormy weather, the maximum height of waves is 2.5 m. at a wave period of approximately 6 seconds.

Wind:

(a) South West Monsoon season (May to October):
The prevailing wind during South West Monsoon season is from the S.W.
This area is affected by squalls associated with cumulonimbus clouds and thunder storms. The storms can be very severe and peak gusts of 60 knots are not uncommon. The peak gust is brief and the wind settles therafter between 20 – 30 knots. All squalls are accompanied by torrential rain.

(b) North East Monsoon season (November to April):
Predominant direction:

November to January	North, East and Variable
February to March	South and East
April	Variable

The velocity of the wind during this period is about 15 knots, and only rarely increases to 25 knots.

OPERATOR: Thai Oil Co. Ltd.
Head Office: G.P.O. Box 2387, Bangkok 10501. *Tel:* (02) 2850020. *Telex:* 20447, 82695, 84095 Thaioil Th. *FAX:* (02) 2850599.
Refinery: Sukhumvit Road, (Km. 124.5), Au Udom, Sriracha, Cholburi 20230, Thailand. *Tel:* (038) 351555. *Telex:* 85802, 85808 Thaioil Th. *FAX:* (038) 351554. *Contact:* Thongchai Trakulyingyong, Marine Manager.

(C) THAI OIL – CBM

LOCATION: The TOC CBM of Thaioil Co.Ltd. Sriracha, is a Conventional Buoy Mooring (CBM) and located between the island of Kosichang and mainland Thailand in position (PLEM): Lat. 13° 07′ 29.8″ N., Long. 100° 52′ 32.7″ E. The water depth is approximately 14.5 m. (Ref. B.A. Chart No. 986 "Approaches to Ao Udom").

DOCUMENTS: See "Part (B)".

PILOTAGE: The Government Pilot and Thaioil Representatives will board the incoming vessel approximately 1.0 nautical miles S.W. of the CBM in the pilot boarding area, as indicated on B.A. Chart No. 986.

RESTRICTIONS: Berthing is carried out in daylight only. Unberthing is carried out at any time, weather permitting.

MAX. SIZE: The buoy is designed to accommodate tankers of sizes between 30,000 d.w.t. and 120,000 d.w.t., with LOA not below 560 ft. or exceeding 900 ft., and a maximum distance from bow to centre of manifold of 450 ft.

Draft Information: The maximum safe draft at the CBM at any low water is 14.62 m. and is calculated as follows:

Chart Datum above LLW	14.63 m. (48 ft.)
Under-keel Clearance	0.61 m. (2 ft. minus)
Rise in Tide	0.60 m. (minimum rise in tide at any day)
Maximum Draft	14.62 m.

Vessels with a draft greater than 14.62 m. up to a maximum of 15.00 m. can also be accommodated, but they have to discharge against the tide, and it has to be assured that for a minimum of 12 hours immediately prior to berthing, the water level is above 15.00 m., which due to the non-harmonic type of tide in Sriracha will not cause undue delays.

HEALTH: See "Documents" in "Part (B)".

RADIO: *Information required prior to Arrival:* Vessel's arrival draft and ETA to be given 7, 3, 2 and 1 days prior to arrival. Vessels should attempt to arrive on even-keel or as close to even-keel as possible.

VHF: Initial contact with the Pilot can be made on VHF Channel 16. Once the contact is established, communication will be switched to Channel 13.

Communication during discharge between ship and shore is carried out by the Thaioil Representative on board.

In addition, the ship is to keep a constant radio watch on Channel 73.

TUGS: Tugs are compulsory during berthing or unberthing and are available for emergencies. 2 tugs of 2,400 b.h.p. and 2 of 1,900 b.h.p. are available.

For vessels with a LOA of 700 ft. and above, 2 tugs are required, one of which is to have a minimum of 2,400 b.h.p. and the other 1,900 b.h.p. The tugs are made fast on the maindeck at the forward and aft offshore shoulder of the vessel respectively.

For vessels with a LOA of up to 700 ft., one tug only is required, which is made fast on the maindeck at the forward offshore shoulder.

BERTHING: *Conventional Buoy Mooring:* The CBM consists of 3 head and 3 stern mooring buoys of cylindrical reclining type, which are secured with a 3.75 in. diameter studlink chain to the anchoring system.

The buoy pattern is effectively one mooring buoy at each corner of the berth, with one further buoy at each end of the central axis of the berth. The "quarter" mooring buoys are located respectively at approximately 60° from the central axis of the berth.

The central axis of the berth lies in direction 024° – 204°.

Mooring Requirements: A total of 18 ship's mooring ropes/wires are required, which makes 3 moorings to each of the 3 head and 3 stern buoys.

The first mooring to each buoy to be a soft rope.

All mooring wires to have nylon pendants/tails.

Mooring: Procedure discussed with Pilot and Mooring Master prior to mooring.

Unmooring: At first the mooring lines are singled up (last on/first off) until one mooring line remains on every buoy. Thereafter the sequence of letting-go is as follows:

(a) Inner aft buoy.
(b) Inner forward buoy.
(c) Centre aft buoy.
(d) Centre forward buoy.

When all these lines are safely inboard, the anchor is hove-in and the two last lines to the outer aft and forward buoys let go.

The tug(s) then push the vessel out of the buoy pattern until she can proceed on her way.

CARGO OPERATIONS: *Pipeline and Hoses:* Two submarine pipelines of 2.1 km. length and 24 in. diameter connect the CBM with the storage tanks ashore. The pipelines are concrete coated and cathodically protected by sacrificial zinc anodes. The two pipeline end manifolds (PLEM's) are located directly underneath the PLEM-marker buoys and approximately 15 m. – 22 m. (50 ft. – 75 ft.) from the side of the tanker in the berth.

Two underwater hose strings with a length of 73 m. (240 ft.) and an internal diameter of 16 in./12 in. connect each of the two PLEM's with the ship's manifold. Each hose string consists of 2×30 ft. × 16 in. hoses connected to a 30 ft. × 16 in./12 in. tapered hose and followed by 5×30 in. × 12 in. hoses. The last hose is connected to a special lifting blind flange which terminates in a 30 m. × 0.875 in. diameter studlink chain with 5 equally spaced open links (for lifting), which is connected to the pick-up buoy.

Discharge Rate/Pressure: Maximum discharge rate is 3,600 cu.m./hr.

The maximum discharge pressure permitted at the ship's manifold is 10 Bar.

Derrick: Refer to OCIMF Standard.

Derrick with a minimum SWL of 10 tonnes is required to lift the submarine hoses.

Connecting Hoses: Hose connection (2×12 in. ANSI) is carried out by shore personnel with assistance of the ship's crew.

After the tanker is safely moored, the hose equipment, consisting of rope slings, shackles, gaskets, nuts and bolts, Blake stoppers and wire strops, are taken onboard.

The hoses are lifted and connected one at a time, the inner hose first, dependent on the pipeline to be used for the discharge.

The blind flange at the end of each hose string is connected to a 24 m. long lifting chain, which is made of 4 lengths of chain, each 6.0 m. long, and connected to each other with an open link. The end of the lifting chain is connected to a PVC buoy.

The launch picks-up the buoy and secures the upper open link on deck and brings the hose directly under the derrick head. The derrick runner hook is then secured to the upper open link and the chain is lifted out of the water until sufficient length is available for connecting the derrick runner hook to the second next open link. This procedure is repeated until the hose comes out of the water and sufficient length is available for direct connection to the ship's manifold.

The weight of the hose is then transferred to the snubbing chain by tightening the connecting chain which is shackled to the snubbing chain and securing it in the Blake stopper, which itself is to be secured to the ship's manifold bitts. The blank flange is removed and the hose connected to the ship's manifold. The butterfly valve at the hose end is opened and secured.

After connecting, both hoses are supported by rope slings suspended from the derrick runner hook, in order to maintain a reasonable radius of bend. If necessary, the hoses are lashed on each side of the hose bar to reduce movement caused by swell.

Ship's impressed current cathodic protection – if operational – should be kept on.

Discharge of Cargo: Only one grade can be discharged at a time, dependent on shore requirements.

The quantity discharged is to be checked and compared with shore on the full hour at 2 hourly intervals. If at night the difference between ship and shore exceeds 1,000 cu.m., then the cargo has to be stopped and the cause has to be investigated, in order to ensure that no sub-sea leaks develop undetected.

During discharge, the hoses and the surrounding area should be checked frequently for oil leaks. If any oil leak is detected, the Marine Supervisor, who remains on board throughout the vessel's stay at the CBM, is to be informed without delay.

Crude Oil Washing (COW): MARPOL 73/78 Convention requires that crude oil washing be carried out during discharging. Full crude oil washing will be subject to terminal agreement.

COW is to be carried out in accordance with the ship's COW Operations Manual and with the International Safety Guide for Oil Tankers and Terminals (ISGOTT).

Inert Gas Failure: In the event of an inert gas plant failure, discharge and crude oil washing must be stopped until the I.G. system is fully operational again.

Hose Disconnection: This operation is carried out by shore personnel with the assistance of the ship's crew.

Once cargo has been completed, the ship can close her manifolds. The butterfly valves at the end of the hoses are closed and secured, and the hoses disconnected and blanked-off. The cargo runner hook is connected to the first open link of the lifting chain of the outer hose and the hose lifted clear of the deck, transferring the weight from the snubbing chain. The Blake stopper is removed from the connecting chain and the hose lowered into the water in the same stages as during pick-up. The mooring launch will secure the last open link of the lifting chain on her deck and disconnect the cargo runner hook. The PVC buoy is reconnected and the hose towed clear of the ship's side. The same procedure is repeated for the second (inner) hose, and thereafter the hose gear is lowered into the mooring launch prior to unmooring.

BALLAST: Masters are advised to commence taking permanent ballast as soon as necessary to keep the vessel at maximum safe draft, not exceeding 14.6 m.

MEDICAL: Doctor, dentist and hospital are available.

FRESH WATER: Available by barge at anchorage only. Minimum order is 200 tonnes, delivery rate approximately 30 tonnes/hr.

FUEL: All bunkers are available by barge at anchorage only. Quantities are limited unless advanced notice is given. It is recommended to confirm bunker requirements on arrival. Failure to do so may result in cancellation or delay.

REPAIRS: Only minor repairs can be carried out by local workshops or by Bangkok's facilities. Advance notice is necessary since spare parts are difficult to obtain.

Immobilisation: Immobilisation of engines or steering gear is not permitted at any time while the vessel is moored at the CBM.

REPATRIATION: Available via Bangkok. Advance notice on crew member's particulars is required.

SHORE LEAVE: Shore leave is permitted. No passes required. Boat service to be arranged via Agent.

GENERAL: *Berth Security and Safety:* Throughout the vessel's stay at the CBM, no other craft (i.e. bunker, water, and stores barge, etc.) is permitted to moor alongside the vessel, the sole exception being the mooring launch.

Accommodation Ladder: Accommodation ladder to be rigged on both sides, ready for the Pilot and later the Government Authorities, to board the vessel.

Shore Personnel: A representative of Thaioil will stay onboard throughout the vessel's stay at the CBM. Adequate accommodation and messing facilities should be provided.

Additonally, 6 men shore crew, who stand-by for emergency hose disconnection, will remain on board. The shore crew will not need to be accommodated in cabins, but will be satisfied with a room, such as the gym or a table tennis room. They will be provided with their own food, but will require water.

At times, the ship's Agent will provide 2 Marine Police who will require accommodation and messing facilities.

In additon, 2 surveyors normally stay on board.

Stores and Provisions: Available at 48 hours notice. Fresh provisions are available in ample quantities and of good quality. Deck/engine stores are usually available in reasonable quantities, but selection is limited.

WEATHER: See "Part (B)".

AUTHORITY: See "Part (B)".

AGENT: Jardine Pacific (Thailand) Ltd., 81/11 Chermcholpol Road, Sriracha, Cholburi, Thailand. Tel: 66-2-311050, 311587. Telex: 75807 Alsrajath. Fax: 66-2-321933.

All initial correspondence to be sent to Bangkok Head Office.

GENERAL: (Also see Page 1953)

New Maritime Regulations for Bosphorus Traffic:

Masters/Owners/Agents of vessels must comply with the following rules when proceeding through the Straits and the Marmara Sea to ensure safety of life and property.

1. Masters or Owners or Charterers of vessels which are 500 gross tons or more, 24 hours before entering the mouth of the Strait of Istanbul or the Strait of Canakkale, must give Sailing Plan 1 (SP1) to Traffic Control Centre through their Agents, and Masters of vessels must give Sailing Plan 2 (SP2) by VHF Channel 16 or 71, directly to Traffic Control Centre, 2 hours before arriving at the mouth of the Strait or at a distance of 20 nautical miles from the mouth of the Strait, whichever comes first.

   Sailing Plan 1:
   (A) Ship's name, call sign, flag.
   (B) Date and time.
   (C) Position (reporting position).
   (F) Sea speed, max. continuous manoeuvring speed.
   (G) Port of departure.
   (H) Date, time and point of entry into Traffic Separation Scheme.
   (I) Port of destination.
   (J) Request Pilot (Yes/No).
   Strait of Istanbul.
   Sea of Marmara.
   Strait of Canakkale.
   (O) Forward and aft draft (m.).
   Max. air draft (m.).
   (P) Type of cargo.
   (Q) Defect/damage/deficiencies/other limitations.
   (R) Description of dangerous, nuclear and pollution goods.
   (T) Ship's type/size.
   Length overall (LOA) in metres.
   Present displacement.
   G.R.T.
   (X) Any other information.

   Sailing Plan 2:
   (A) Ship's name, call sign, flag.
   (D) Position (bearing – distance) (See Note).
   (H) Date, time and point of entry into Traffic Separation Scheme.

(J) Request Pilot (Yes/No).
Strait of Istanbul.
Sea of Marmara.
Strait of Canakkale.
(Q) Defect/damage/deficiencies/other limitations.
(X) Any other information.

Note:
Reference points for the position in (D) above:
Turkeli Light.
Ahirkapi Light.
Gelibolu Light.
Mehmetcik Light.

2. The Owner or operator of large vessels, which plan to pass through the Straits, shall provide information on the vessel and its cargo to the administration at the planning stage of the passage. The administration, taking into consideration the morphological and physical structure of the Straits, the vessel's dimensions and the manoeuvring capability, the safety of life, property and the environment and maritime traffic conditions, shall inform the applicants of the outcome of its review.
3. Vessels of 150 m. or more in length are strongly recommended to take a Pilot for safety purposes.

ANTALYA: (Also see Page 1959) **(See Late Plans)**

The sections under the headings below should be replaced with the following:

TUGS: 3 tugs (240 h.p., 900 h.p. and 1,125 h.p.).

BERTHING: Outer breakwater is 1,440 m. long, inner breakwater is 650 m. long. Port area is 331,600 sq.m.

Vessels can enter port and anchor at any time with a Pilot aboard. Manoeuvring area has 400 m. diameter, depths 8 m. – 11 m.

11 operating quays, 2 passenger quays and a military quay available.

Quay No.	*Length* (m.)	*Depth* (m.)
1	150	10.00
2, 3	165	5.5 – 6.5
4	60	8.00
5, 6	290	10.00
7	170	10.00
8 (Passenger Quay)	170	10.00
9 (Passenger Quay)	140	5.50
10 T.M.O.	200	10.00
11 SEKA	200	8.00
12 (Military Quay)	270	5.50
4 Ro/Ro	35	5.50

Storage:

Open warehouse area is 200,000 sq.m. Closed warehouse area is 3,000 sq.m. Closed warehouse (for combustible cargo) is 400 sq.m.

Cold storage plant is 6,900 sq.m. with capacity of about 10,000 tons.

PORT EQUIPMENT:

8 cranes (1×25 tons (fixed), 2×10 tons, 5×5 tons).
5 mobile cranes (3×10 tons, 1×25 tons, 1×40 tons).
16 forklifts (10×3 tons, 3×5 tons, 2×10 tons, 1×25 tons).
4 tractors.
26 trailers (20×2 tons, 4×6 tons, 2×25 tons).

FRESH WATER: Fresh water supplied from hydrants on quays by watermen. Rate of delivery is 32 t.p.h. – 40 t.p.h. Water also available by barge of 300 tonnes capacity.

WASTE OIL DISPOSAL: Waste oil disposal service is available. Charges are as follows:

	Cost (U.S.$)/1,000 g.r.t.	
	Flag of Ship	
Method of Service	*Turkey*	*Others*
On Quay	20	60
At Anchor	40	120

Facilities include two oily water separators of 2 tons per hour capacity and a shore tank of 100 tons capacity.

Contact – Tel: 0242-2481469/2481494. Telex: 56186 ANDETR. Fax: 0242-2483346, for further details.

ADEN: (Also see Page 2441)

SHIPMASTER'S REPORT: October 1994.

Vessel called at Aden for bunkers and fresh water.

Documents:
Agent:
3 copies Crew List.
Customs:
1 copy Crew List.
2 copies Customs Declaration.
1 copy Crew Declaration.
Immigration:
2 copies Crew List.
Police:
2 copies Crew List.

Arrival Declaration filled in by Agent after arrival. Departure Declaration was also signed for Agent to fill in later for Departure Clearance. No Ship's Certificates were requested by the Agent or the Port Authorities. Immigration officers check passports. Shore leave allowed with Passports/Seaman's Book. Agent and Port Authorities very co-operative and arrival formalities were quick and smoothly carried out.

Agent returned on board prior to vessel's departure to give Port Clearance papers and instructions to call Aden Port Control by VHF Channel 16 for Pilot when vessel is ready to sail.

Pilotage/VHF: When 25 miles from Aden and approaching from the West, Aden Port Control was contacted on VHF Channel 16. Following information was requested:

Ship's name.
Flag.
G.r.t.
Type of vessel.
Draft.
Last Port.
Next Port.
Agent in Aden.

We were then instructed to call again when vessel was 4 miles off the Fairway Buoy. We reported again when vessel was 4 miles off the Fairway Buoy, and were then informed by Port Control that no arrangements made by our Agent for Pilot to bring the vessel into port. We were then instructed to anchor vessel 2.5 miles S.W. of the Fairway Buoy and to report again when vessel was anchored.

After reporting anchoring time and position back to Port Control, we were then instructed to call our Agent on VHF Channel 16. Agent was then contacted on Channel 16 with working Channel 11. We were then informed by our Agent that as no confirmation from the bank of funds from the Owners received by them yet, vessel will not be allowed into the port and we were to keep VHF watch on Channel 16 for their call again when confirmation was received. Two other vessels were also outside the anchorage who had arrived 2 days before us and were similarly waiting for confirmation of funds from their Owners to the Agents.

Next morning, our Agent called again on VHF to advise that funds had been received by them and vessel could now proceed into port for bunkers and fresh water. Thereafter Aden Port Control called up for vessel to heave-up anchor and proceed to the Fairway Buoy, where the Pilot will board. Pilot boards near the Fairway Buoy with lee side pilot ladder.

For departure, call Aden Port Control for Pilot. Vessel has to inform them that Port Clearance papers are on board and no barges alongside the vessel. Pilot checks the Port Clearance papers after boarding. We were instructed to exhibit the pilot lights (red – white – red) vertically on the masts. As our vessel did not have the lights required, we informed Port Control about it and they were kind enough to disregard the lights. Pilot and mooring gang arrived together 45 minutes later by boat. Pilot disembarks after clearing harbour entrance breakwater and at No. 4 Buoys. We were informed by the Pilot that some of the buoys are unlit, but can be picked-up clearly on the radar. No. 2 and No. 3 starboard green lights were not lit. Similarly No. 1 port red light was not lit. The Fairway Buoy could not be seen to be lit also.

Mooring: Vessel berthed starboard side alongside dolphin berth with bunkering facilities, but which were not used during bunkering. One tug and 2 mooring boats meet the vessel near the berth, but the tug was not used. Port anchor was let-go while coming alongside with 1.5 shackles out. 3 mooring ropes were used forward and aft, 2 ropes as springs, 2 ropes as stern lines to the dolphin berth, and remaining 2 ropes also as stern lines to buoys forward and aft of the dolphin berth. Pilot disembarks to the mooring boat after vessel is all fast alongside.

During departure, one tug is made fast at the stern with ship's line. All lines were cast-off and the port anchor heaved-up with the tug aft pulling the stern of the vessel, away from the berth. When the port anchor was aweigh, engines were used with astern movements to swing the vessel round to starboard to face the entrance harbour breakwater. Tug was then cast-off from the stern.

Fuel: The gas oil bunker barge came alongside the vessel on the port side soon after vessel was made fast. Bunkering was commenced immediately on arrival, even before ship was cleared by the Port Authorities. Minimum amount of gas oil to be supplied was 35 tons. Bunkering went smoothly.

Fresh Water: The fresh water barge also came alongside and made fast forward of the bunker barge. After completion of bunkering and the bunker barge had cast-off, the fresh water barge moved aft to take its place and commenced to supply fresh water to the vessel. Capacity of the fresh water barge was approximately 200 tons. Supply was made using normal canvas hose, and there were 3 supply outlets to supply to different tanks on board our vessel simultaneously. We were informed by the Agent that there are 3 fresh water barges in Aden port, but only one is available to suppply fresh water to the vessels in port, as the other 2 barges were undergoing repairs at the time. Cost of fresh water is U.S.$ 4.00/ton.

Notices and Circulars: Also see "Shipmaster's Report" dated March 1985 – "Notices". These notices are still in effect.
